About This Guide

The Cisco network-based IPSec VPN solution release 1.5 is a network-based IP security (IPsec) Virtual
Private Network (VPN) integrated solution that allows a service provider to offer scalable services to
securely connect remote locations to a customer's corporate VPN extranet or intranet.

This document and other documents related to this solution can be found under Cisco Network-Based
IPSec VPN Solution at the following URL:

Note

All Cisco solutions documents can be found under Cisco Solutions at the following URL:

This preface presents the following major topics:

- Audience
- Scope
- Document Organization
- Related Documents
- Document Conventions
- Obtaining Documentation
- Obtaining Technical Assistance

Audience

The target audience for this guide is assumed to have familiarity with basic Cisco IOS commands and
operations for configuring the following Cisco components:

- Cisco 7204 and Cisco 7206 routers
- Cisco 800 series routers
- Cisco 1700 series routers
- Cisco 2600 series routers
- Cisco 3600 series routers
- Cisco VPN 3002 hardware clients
Scope

This guide presents the fundamental design and configuration information that is required to establish the various services provided by the Cisco Network-Based IPSec VPN Release 1.5. Service provider networks may have additional requirements that are beyond the scope of this document.

In addition, this document is primarily for Cisco products. To establish and maintain third-party products and applications that may be a part of the Cisco Network-Based IPSec VPN Release 1.5, refer to the documentation provided by the vendors of those products.

Document Organization

The chapters of this guide are as follows:

- Chapter 1, “Establishing Solution Components” provides information on establishing required components, establishing optional components, and basic configurations.
- Chapter 2, “IPSec to MPLS Service Models” describes how to configure this deployment model.
- Chapter 3, “IPSec to L2VPN Service Model” describes how to configure this deployment model.
- Chapter 4, “IPSec to IPSec Service Model” describes how to configure this deployment model.
- Chapter 5, “IPSec to GRE Service Models” describes how to configure this and related deployment models.
- Chapter 6, “Configuring AAA Servers for Remote Clients” provides configuration information for AAA servers, Unity clients, and RADIUS servers.
- Glossary—Defines abbreviated terms used in this document.
- Index

Related Documents

Most of the documents referred to in the Cisco Network-Based IPSec VPN Solution Release 1.5 Implementation Guide are available online. In the electronic (PDF) version of this document you can click the URL (Uniform Resource Locator, often referred to as the website) associated with the title of a document, and the selected document will appear within the Adobe Acrobat application window. You can also use the Text Select Tool (third icon from the top, at the left of the Acrobat application window) to copy a URL from the PDF document and paste it into the location field of your browser.

Viewing Online Documents in Your Browser

As you click on links, the files you select may be added to the current document. When you close the file, you will be prompted to save the file. (You will not be able to save the file to a CD.) If you choose not to save the larger file that is created, click No when prompted to save the file. However, if you acquire documents that you want to save in a new file, you can save that file to another disk or drive with a new name of your own choosing. Set the following preferences within the Acrobat application to open weblinks in your browser, rather than within Acrobat.

Step 1  Select the browser you want to use.
   a. From the Acrobat main menu, choose **File > Preferences > Weblink**. The Weblink Preferences window opens.
   b. In the Weblink Preferences window, click Browse (or Select) and locate the browser you wish to use.
   c. Select Connection Type from the pull-down menu. Choose Standard if your browser is not listed.
   d. Click **OK** to save your settings.

Step 2  Make sure that Acrobat opens weblinks in your browser.
   a. From the Acrobat main menu, choose **File > Preferences > Web Capture**. The Web Capture Preferences window opens.
   b. Choose Open Weblinks: In Web Browser.
   c. Click **OK** to save your settings.

---

**Document Conventions**

Command descriptions use the following conventions:

<table>
<thead>
<tr>
<th><strong>boldface font</strong></th>
<th>Commands and keywords are in <strong>boldface</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>italic font</strong></td>
<td>Arguments for which you supply values are in <strong>italics</strong>.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>{ x</td>
<td>y</td>
</tr>
<tr>
<td>[ x</td>
<td>y</td>
</tr>
<tr>
<td><strong>string</strong></td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
</tbody>
</table>

Screen examples use the following conventions:

<table>
<thead>
<tr>
<th><strong>screen font</strong></th>
<th>Terminal sessions and information the system displays are in <strong>screen font</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface screen font</strong></td>
<td>Information you must enter is in <strong>boldface screen font</strong>.</td>
</tr>
<tr>
<td><strong>italic screen font</strong></td>
<td>Arguments for which you supply values are in <strong>italic screen font</strong>.</td>
</tr>
<tr>
<td>→</td>
<td>This pointer highlights an important line of text in an example.</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters, such as passwords, are in angle brackets in contexts where italic font is not available. Also used to represent variables in command line examples where <strong>screen font</strong> is used.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td>!, #</td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>
1. As this document makes use of annotated configurations, the rigorous use of boldface type to indicate what the user must enter is relaxed.

Note the use the following conventions:

- **Note**: Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use the following conventions:

- **Caution**: Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Tips use the following conventions:

- **Tip**: Means the following information *will help you solve a problem*. The tips information might not be troubleshooting or even an action, but could be useful information, similar to a Timesaver.
Terms and Acronyms

For definitions of terms and acronyms used in the following chapters, refer to the glossary at the end of this document.

For an online listing of internetworking terms and acronyms, refer to the following URL:

Obtaining Documentation

Cisco provides several ways to obtain documentation, technical assistance, and other technical resources. These sections explain how to obtain technical information from Cisco Systems.

Cisco.com

You can access the most current Cisco documentation on the World Wide Web at this URL:
http://www.cisco.com/univercd/home/home.htm
You can access the Cisco website at this URL:
http://www.cisco.com
International Cisco websites can be accessed from this URL:

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which may have shipped with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual subscription.

Registered Cisco.com users can order the Documentation CD-ROM (product number DOC-CONDOCCD=) through the online Subscription Store:
http://www.cisco.com/go/subscription

Ordering Documentation

You can find instructions for ordering documentation at this URL:
You can order Cisco documentation in these ways:
• Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Networking Products MarketPlace:
• Registered Cisco.com users can order the Documentation CD-ROM (Customer Order Number DOC-CONDOCCD=) through the online Subscription Store:
About This Guide

Obtaining Technical Assistance

You can submit comments electronically on Cisco.com. On the Cisco Documentation home page, click Feedback at the top of the page.
You can e-mail your comments to bug-doc@cisco.com.
You can submit your comments by mail by using the response card behind the front cover of your document or by writing to the following address:
Cisco Systems
Attn: Customer Document Ordering
170 West Tasman Drive
San Jose, CA 95134-9883
We appreciate your comments.

Documentation Feedback

Obtaining Technical Assistance

Cisco provides Cisco.com, which includes the Cisco Technical Assistance Center (TAC) Website, as a starting point for all technical assistance. Customers and partners can obtain online documentation, troubleshooting tips, and sample configurations from the Cisco TAC website. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC website, including TAC tools and utilities.

Cisco.com

Cisco.com offers a suite of interactive, networked services that let you access Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.
Cisco.com provides a broad range of features and services to help you with these tasks:
- Streamline business processes and improve productivity
- Resolve technical issues with online support
- Download and test software packages
- Order Cisco learning materials and merchandise
- Register for online skill assessment, training, and certification programs
To obtain customized information and service, you can self-register on Cisco.com at this URL:
http://www.cisco.com
Technical Assistance Center

The Cisco TAC is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two levels of support are available: the Cisco TAC website and the Cisco TAC Escalation Center. The avenue of support that you choose depends on the priority of the problem and the conditions stated in service contracts, when applicable.

We categorize Cisco TAC inquiries according to urgency:

- **Priority level 4 (P4)** — You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration.
- **Priority level 3 (P3)** — Your network performance is degraded. Network functionality is noticeably impaired, but most business operations continue.
- **Priority level 2 (P2)** — Your production network is severely degraded, affecting significant aspects of business operations. No workaround is available.
- **Priority level 1 (P1)** — Your production network is down, and a critical impact to business operations will occur if service is not restored quickly. No workaround is available.

Cisco TAC Website

You can use the Cisco TAC website to resolve P3 and P4 issues yourself, saving both cost and time. The site provides around-the-clock access to online tools, knowledge bases, and software. To access the Cisco TAC website, go to this URL:

http://www.cisco.com/tac

All customers, partners, and resellers who have a valid Cisco service contract have complete access to the technical support resources on the Cisco TAC website. Some services on the Cisco TAC website require a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to this URL to register:

If you are a Cisco.com registered user, and you cannot resolve your technical issues by using the Cisco TAC website, you can open a case online at this URL:

If you have Internet access, we recommend that you open P3 and P4 cases through the Cisco TAC website so that you can describe the situation in your own words and attach any necessary files.

Cisco TAC Escalation Center

The Cisco TAC Escalation Center addresses priority level 1 or priority level 2 issues. These classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer automatically opens a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to this URL:

Before you call, check with your network operations center to determine the level of Cisco support services to which your company is entitled: for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). When you call the center, have your service agreement number and your product serial number available.
Obtaining Additional Publications and Information

Information about Cisco products, technologies, and network solutions is available from various online and printed sources.

- The *Cisco Product Catalog* describes the networking products offered by Cisco Systems as well as ordering and customer support services. Access the *Cisco Product Catalog* at this URL:

  http://www.ciscopress.com

- *Packet* magazine is the Cisco monthly periodical that provides industry professionals with the latest information about the field of networking. You can access *Packet* magazine at this URL:

- *iQ Magazine* is the Cisco monthly periodical that provides business leaders and decision makers with the latest information about the networking industry. You can access *iQ Magazine* at this URL:

- *Internet Protocol Journal* is a quarterly journal published by Cisco Systems for engineering professionals involved in the design, development, and operation of public and private internets and intranets. You can access the *Internet Protocol Journal* at this URL:

- Training—Cisco offers world-class networking training, with current offerings in network training listed at this URL:
Establishing Solution Components

Use the *Cisco Network-Based IPSec VPN Solution Release 1.5 Implementation Guide* to establish, configure, and manage the services introduced in the Cisco network-based IPSec VPN solution release 1.5. Links to this and other documentation related to this solution are available at the following URL: [http://www.cisco.com/univercd/cc/td/doc/solution/index.htm](http://www.cisco.com/univercd/cc/td/doc/solution/index.htm).

To configure a network that takes advantage network-based IPSec VPNs, read the *Cisco Network-Based IPSec VPN Solution Release 1.5 Overview and Planning Guide*.

This chapter briefly introduces and presents links for the following major topics:

- Establishing required and optional components
- Basic configurations

The service models supported by the Network-Based IPSec VPN are as follows (refer to Chapter 2, in the *Cisco Network-Based IPSec VPN Solution Release 1.5 Overview and Planning Guide*):

- IPSec into MPLS VPN
- IPSec to L2VPN
- IPSec to IPSec
- IPSec to GRE

---

**Note**

Only the fundamental steps to establish unified communications are described in Chapter 2 of the *Cisco Network-Based IPSec VPN Solution Release 1.5 Overview and Planning Guide*, to illustrate the basic issues.

Establishing Required Components

Establishing Access Concentrators

The equipment you need for a network-based IPSec VPN may already be installed in your network. For the latest information on installing and configuring components, including release notes, refer to the URLs listed in this chapter.

The following Cisco access concentrators are required parts of the solution:

- Cisco 7204 router
- Cisco 7406 router
Cisco 7204 Router

Refer to Cisco 7206 router at the following URL:

For specific information, see:
- Cisco 7204 Installation and Configuration Guide
  http://www.cisco.com/univercd/cc/td/doc/product/core/7204/7204ig/index.htm
- Quick Reference For Cisco 7204 Installation
- Cisco 7200 Regulatory Compliance and Safety Information
- Site Preparation and Safety Guide
- Cisco 7200 Series Port Adapter Hardware Configuration Guidelines
  http://www.cisco.com/univercd/cc/td/doc/product/core/7206/port_adp/config/index.htm
- Port Adapters
- Field Replaceable Units (FRUs)
- Cisco 7200 Troubleshooting
  http://www.cisco.com/univercd/cc/td/doc/product/core/7200vx/7200trbl.htm
- Links to Other Documentation and Sites
  http://www.cisco.com/univercd/cc/td/doc/product/core/7202/7200link.htm
- Cisco 7200 Series Routers Boot Image Information
  http://www.cisco.com/univercd/cc/td/doc/product/core/7200vx/14936b.htm

Installing VPN Acceleration Module

For information on the VPN Acceleration Module (VAM), see:

To install VAM cards, see:

Configuring Cisco IOS Software

For information on the Cisco IOS software release used with the Cisco 7204 router for the Cisco network-based IPSec VPN solution release 1.5, see

Cisco 7206 Router

Refer to Cisco 7206 router at the following URL:

For specific information, see:
• Cisco 7200 Series Routers and Cisco 7401ASR Documentation
  http://www.cisco.com/univercd/cc/td/doc/product/core/7200vx/12767f.htm
• Cisco 7206 Installation and Configuration Guide
  http://www.cisco.com/univercd/cc/td/doc/product/core/7206/7206ig/index.htm
• Cisco 7206 Quick Start Guide
  http://www.cisco.com/univercd/cc/td/doc/product/core/7206/12771q.htm
• Quick Reference For Cisco 7206 Installation
• Cisco 7200 Regulatory Compliance and Safety Information
• Site Preparation and Safety Guide

Installing VPN Acceleration Module

To install VAM cards, see:
09186a008007c95c.html.

Configuring Cisco IOS Software

For information on the Cisco IOS release used with the Cisco 7204 router for the Cisco network-based
IPSec VPN solution release 1.5, see:

Establishing Internet Protocol Solutions Center Version 3.0

Cisco Internet Protocol Solutions Center (ISC) Version 3.0 offers support for IPSec as well as support
for MPLS (multiprotocol label switching). It provides a customizable service and network layers FCAPS
(fault, configuration management, accounting, performance, security) management solution to facilitate
rapid IP VPN service deployment and reduce ongoing operational costs.

For information on using ISC Version 3.0 to set up devices in an IPSec environment as well as defining
IPSec networks and customers, see
Establishing Optional Components

The following Cisco platforms can be used as customer premises equipment at the remote locations for IPSec termination to the Cisco 7200 series router:

Cisco PIX Firewall with EzVPN client

Refer to Cisco PIX Firewall with EzVPN client at the following URL:
http://www.cisco.com/univercd/cc/td/doc/product/iaabu/pix/pix_sw/v_62/config/basclnt.htm#xtocid0.

Cisco VPN 3002 Hardware Client

Refer to Cisco VPN 3002 hardware client at the following URL:

Cisco 800 Series Routers

Refer to the following Cisco 800 series routers at the following URLs:
- Cisco 801 through 804 routers:
- Cisco 805 router:
- Cisco 806 router
- Cisco 811 and Cisco 813 routers
- Cisco 826 router
- Cisco 827 routers
- Cisco 828 and SOHO 78 routers

Cisco 1700 Series Routers

Refer to Cisco 1700 series routers at the following URL:

Cisco 2600 Series Routers

Refer to Cisco 2600 series routers at the following URL:
Cisco 3600 Series Routers

Refer to Cisco 3600 series routers at the following URL:

Cisco 7200 Series Routers

Refer to Cisco 7200 series routers at the following URL:

- Cisco 7200
- Cisco 7010

  http://www.cisco.com/univercd/cc/td/doc/product/core/7200vx/index.htm
- Cisco 7202
- Cisco 7204
- Cisco 7206
IPSec to MPLS Service Models

This chapter describes how to configure the IPSec to MPLS and GRE+IPSec into MPLS service models for the Cisco Network-Based IPSec VPN Release 1.5.

Configuring the IPSec to MPLS Service Model

In the IPSec to MPLS configuration, the service provider has an existing MPLS backbone and operates an MPLS VPN that interconnects all customer sites. This includes remote customer sites that are part of the MPLS VPN.

This configuration enables secure off-net access to MPLS VPNs through IPSec. It allows MPLS providers to extend access to their on-net MPLS VPNs to include worldwide Internet access. Customers who wish to deploy a dynamic routing model can use GRE combined with IPSec (see Configuring GRE+IPSec to MPLS Service Model, page 2-15).

A remote customer site initiates an IPSec session from the CE that terminates on a unique interface on the aggregating Cisco 7200 PE. The Cisco 7200 PE then maps the site from the interface to its respective VPN.

Each VPN is associated with one or more VPN routing or forwarding instances (VRFs). A VRF consists of an IP routing table, a derived Cisco express forwarding (CEF) table and a set of interfaces that use this forwarding table. VRF provides multiple routing instances with each instance independent of others within an IPSec aggregator. You can associate the VRF with one or more VPNs.

As a provider edge (PE) router on the MPLS network, the Cisco 7200 series router advertises the connected routes to the remote PEs containing the same VPN.

Before You Begin

The procedures provided here are specific to configuring IPSec to MPLS and are based on the following assumptions:

1. That the following setup and configuration tasks have already been completed:
   - Setup of the core MPLS network
   - Setup of the customer VPN
   - Configuration of the links between the PE and the CE
   - Customer-specific information is complete
2. That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies to use for address management or for user authentication and authorization).

**IPSec to MPLS Configuration Checklist**

This section deals with configuring the router to function as both the IPSec Aggregator and the PE router. Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

</tr>
<tr>
<td>Task 30: Configure the Crypto Access List to Define Traffic to be Encrypted, page 2-10</td>
</tr>
</tbody>
</table>

IPSec to MPLS Configuration Tasks

Typical IPSec to MPLS configuration tasks are shown below. Refer to the section titled IPSec to MPLS Configuration Sample, page 2-11.

Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: aaa authentication login</td>
<td>Set authentication, authorization, and accounting (AAA) authentication at login.</td>
</tr>
<tr>
<td>Step 2: aaa authorization</td>
<td>Set parameters that restrict user access to a network.</td>
</tr>
</tbody>
</table>

Task 2: Configure VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: ip vrf</td>
<td>Configure a VPN routing and forwarding (VRF) routing table.</td>
</tr>
<tr>
<td>Step 2: rd route-distinguisher</td>
<td>Create routing and forwarding tables for a VRF.</td>
</tr>
<tr>
<td>Step 3: route-target {import</td>
<td>export</td>
</tr>
</tbody>
</table>

Task 3: Enable CEF Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: ip cef</td>
<td>Enable Cisco Express Forwarding (CEF).</td>
</tr>
<tr>
<td>Step 2: mpls label protocol {ldp</td>
<td>tdp}</td>
</tr>
<tr>
<td>Step 3: tag-switching ip default-route</td>
<td>Enable the distribution of labels associated with the IP default route.</td>
</tr>
</tbody>
</table>
## Task 4: Configure the Keyring

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during Internet Key Exchange (IKE) authentication.</td>
</tr>
<tr>
<td>Step 2 pre-shared-key {address address [mask]</td>
<td>hostname hostname} key key</td>
</tr>
</tbody>
</table>

## Task 5: Configure ISAKMP Policy for Phase 1 Negotiations

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>Step 2 encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>Step 3 authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>

## Task 6: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

## Task 7: Configure Client Group for Local Authorization

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp client configuration group {group-name</td>
<td>default}</td>
</tr>
<tr>
<td>Step 2 key name</td>
<td>Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>Step 3 pool (name)</td>
<td>Configure a local pool address.</td>
</tr>
</tbody>
</table>

## Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>
Chapter 2  IPSec to MPLS Service Models

**Task 9: Configure Dynamic VRF Association for VPN Sites**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 vrf name</td>
<td>Associate the on-demand address pool with a VPN routing and forwarding instance (VRF) name.</td>
</tr>
<tr>
<td>Step 2 keyring keyring-name</td>
<td>Associate a keyring with an isakmp profile.</td>
</tr>
<tr>
<td>Step 3 match identity address address [mask] [fvr]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

**Note**
The Remote sites can be configured to match each peer. This is configured using sequence numbers in the crypto map definition. The peer can be matched on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In the case of VPN clients, the dynamic profile defined earlier is used to match the clients.

**Task 10: Configure ISAKMP Profile for VPN Clients**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
<tr>
<td>Step 2 vrf name</td>
<td>Associate the on-demand address pool with a VPN routing and VRF name.</td>
</tr>
</tbody>
</table>

**Task 11: Configure Dynamic VRF Association for VPN Clients**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 vrf name</td>
<td>Associate the on-demand address pool with a VPN routing and VRF name.</td>
</tr>
<tr>
<td>Step 2 match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

**Task 12: Configure XAUTH, Group Authorization, and Mode-Config**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during authentication, authorization, and accounting (AAA) configuration</td>
</tr>
</tbody>
</table>
**Task 13: Configure the Transform Set for Data Encryption**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto IPSec transform-set transform-set-name [transform1] [transform2] [transform3] [transform4]</code></td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

**Task 14: Configure Dynamic Crypto Map and Apply Transform Set**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto dynamic-map dynamic-map-name dynamic-seq-num</code></td>
<td>Create a dynamic crypto map entry and enter the crypto map configuration command mode.</td>
</tr>
<tr>
<td><code>set transform-set transform-set-name</code></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

**Task 15: Configure ISAKMP Client Profile Reference**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set isakmp-profile profile-name</code></td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>

**Task 16: Configure RRI**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reverse-route [remote-peer]</code></td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>

**Task 17: Configure Static Crypto Map for Sites**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto map map-name seq-num [IPSec-isakmp]</code></td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td>`set peer [hostname</td>
<td>ip-address]`</td>
</tr>
<tr>
<td><code>set transform-set transform-set-name</code></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>
Task 18: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name reference.</td>
</tr>
<tr>
<td>match identity address address [mask] [fvrf]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

Task 19: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [IPSec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>

Task 20: Configure BGP Peering Source Interface

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface type</td>
<td>Configure a loopback interface (emulates an interface that is always up).</td>
</tr>
<tr>
<td>ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
</tbody>
</table>

Task 21: Configure Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface type</td>
<td>Configure a loopback interface (emulates an interface that is always up).</td>
</tr>
<tr>
<td>ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
<tr>
<td>encapsulation dot1q vlan-id [native]</td>
<td>Enable IEEE 802.1Q encapsulation of traffic on a specified subinterface in a virtual LAN (VLAN).</td>
</tr>
<tr>
<td>crypto map map-name</td>
<td>Apply a previously defined crypto map set to an interface.</td>
</tr>
</tbody>
</table>

Note: Each interface services one VPN as the IPSec tunnel endpoint for both the sites and clients.
# Configuring the IPSec to MPLS Service Model

## Chapter 2      IPSec to MPLS Service Models

### Task 22: Configure Interface for Tag Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>interface type</code> Configure a loopback interface (emulates an interface that is always up).</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ip address ip-address mask</code> Set an IP address for an interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>encapsulation dot1q vlan-id [native]</code> Enable IEEE 802.1Q encapsulation of traffic on a specified subinterface in a VLAN.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>tag-switching ip</code> Allow label switching of IPv4 packets.</td>
</tr>
</tbody>
</table>

### Task 23: Configure IGP Used in Core for BGP Access

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>router ospf process-id</code> Configure an OSPF routing process.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>log-adjacency-changes</code> Generate a log message.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>network ip-address wildcard-mask area area-id</code> Configure the interfaces on which OSPF runs and to define the area ID for those interfaces.</td>
</tr>
</tbody>
</table>

### Task 24: Configure BGP to Carry VPN Routes

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>router bgp as-number</code> Configure the BGP routing process.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>no synchronization</code> Disable the synchronization between BGP and your Interior Gateway Protocol (IGP) system.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>bgp log-neighbor-changes</code> Enable logging of BGP neighbor resets.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`neighbor {ip-address</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>no auto-summary</code> Disable the default behavior of automatic summarization of subnet routes into network-level routes.</td>
</tr>
</tbody>
</table>

### Task 25: Configure Peers to Receive VPNv4 Routes

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>address-family</code> Enter the address family submode for configuring routing protocols such as BGP, RIP, and static routing.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`neighbor {ip-address</td>
</tr>
</tbody>
</table>
Task 26: Configure IPv4 Address-Family for Each VPN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>address-family</td>
<td>Enter the address family submode for configuring routing protocols such as BGP, RIP, and static routing.</td>
</tr>
<tr>
<td>redistribute protocol</td>
<td>Redistribute routes from one routing domain into another routing domain.</td>
</tr>
<tr>
<td>no auto-summary</td>
<td>Disable the default behavior of automatic summarization of subnet routes into network-level routes.</td>
</tr>
<tr>
<td>no synchronization</td>
<td>Disable the synchronization between BGP and your IGP system.</td>
</tr>
<tr>
<td>exit-address-family</td>
<td>Exit from the address family configuration submode.</td>
</tr>
</tbody>
</table>

Task 27: Configure Pool to Distribute IP Addresses to VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip local pool {default</td>
<td>pool-name low-ip-address high-ip-address}</td>
</tr>
</tbody>
</table>

Task 28: Configure Global Default Route

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip route network-number network-mask {ip-address</td>
<td>interface-name} [distance] [name name]</td>
</tr>
</tbody>
</table>
## Task 29: Configure Static VPN Routes

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip route vrf vrf-name prefix mask [next-hop-address] [interface {interface-number}] [global] [distance] [permanent] [tag tag]</td>
<td>Establish static routes for a VPN routing and forwarding (VRF) instance.</td>
</tr>
</tbody>
</table>

## Task 30: Configure the Crypto Access List to Define Traffic to be Encrypted

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-list access-list-number (deny</td>
<td>permit) source [source-wildcard] [log]</td>
</tr>
</tbody>
</table>
**IPSec to MPLS Configuration Sample**

Figure 2-1 illustrates the following IPSec to MPLS configuration.

**Figure 2-1 IPSec to MPLS Configuration**

pel#sh run
Building configuration...

Current configuration : 3874 bytes

Chapter 2      IPSec to MPLS Service Models

Step 4 Configure the keyring VPN.

crypto keyring vpn1
  pre-shared-key address 20.1.1.1 key cisco123
  pre-shared-key address 40.1.1.2 key cisco123

Step 5 Configure the ISAKMP policy for Phase 1 negotiations.

crypto isakmp policy 1
  authentication pre-share
  group 2

crypto isakmp policy 2
  encr 3des
  authentication pre-share

Step 6 Configure DPD keepalives.

crypto isakmp keepalive 30

crypto isakmp xauth timeout 30

Step 7 Configure client group for local authorization.

crypto isakmp client configuration group ezvpn
  key cisco123
  pool hw-pool

Step 8 Configure ISAKMP profile for VPN sites.

crypto isakmp profile vpn1

Step 9 Configure dynamic VRF association for sites.

vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255
  match identity address 40.1.1.2 255.255.255.255

Step 10 Configure ISAKMP profile for VPN clients.

crypto isakmp profile vpn1-ez
  vrf vpn1

Step 11 Configure dynamic VRF association for VPN clients.

match identity group ezvpn

Step 12 Configure XAUTH, group authorization, and mode-config.

client authentication list localist
  isakmp authorization list localist
  client configuration address respond

Step 13 Configure the transform Set.

crypto IPSec transform-set tset1 esp-3des esp-sha-hmac

Step 14 Configure dynamic cryptomap and apply transform set.

crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1

Step 15 Configure ISAKMP client profile reference.

set isakmp-profile vpn1-ez
Step 16 Configure RRI.
   reverse-route

Step 17 Configure static crypto map for site.
   crypto map vpn 10 IPSec-isakmp
   set peer 20.1.1.1
   set transform-set tset1

Step 18 Configure ISAKMP site profile reference.
   set isakmp-profile vpn1
   match address 101

Step 19 Configure Dynamic crypto map for clients.
   crypto map vpn 1000 IPSec-isakmp dynamic dyna
! interface Loopback0

Step 20 Configure BGP peering source interface.
   ip address 99.1.1.1 255.255.255.255
! interface FastEthernet2/0
   no ip address
duplex auto
speed auto

Step 21 Configure Internet facing interfaces and corresponding crypto maps.
   interface FastEthernet2/0.1
      encapsulation dot1Q 10
      ip address 30.1.1.2 255.255.255.0
      crypto map vpn
! interface FastEthernet2/1
   no ip address
duplex auto
speed auto

Step 22 Configure the interface for tag switching.
   interface FastEthernet2/1.1
      encapsulation dot1Q 10
      ip address 125.1.10.2 255.255.255.0
tag-switching ip
!

Step 23 Configure the IGP used in the Core for BGP Reachability.
   router ospf 1
      log-adjacency-changes
      network 99.1.1.1 0.0.0.0 area 0
      network 125.1.10.0 0.0.0.255 area 0

Step 24 Configure BGP to carry VPN routes.
   router bgp 100
      no synchronization
      bgp log-neighbor-changes
      neighbor 99.1.1.3 remote-as 100
      neighbor 99.1.1.3 update-source Loopback0
no auto-summary

Step 25  Configure peers to receive VPNv4 routes.
address-family vpnv4
neighbor 99.1.1.3 activate
neighbor 99.1.1.3 send-community both
no auto-summary
exit-address-family

Step 26  Configure IPv4 address-family for each VPN.
address-family ipv4 vrf vpn1
redistribute static
no auto-summary
no synchronization
exit-address-family

Step 27  Configure the pool to distribute IP addresses to VPN clients.
ip local pool hw-pool 192.168.1.1 192.168.1.254
ip classless

Step 28  Configure static routes for public IP addresses global default route.
ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1

Step 29  Configure static VPN routes if not using IGP with in the VPN.
ip route vrf vpn1 101.1.1.0 255.255.255.0 30.1.1.1 global
no ip http server
no ip http secure-server

Step 30  Configure the crypto access list to define traffic to be encrypted.
access-list 101 permit ip 101.1.2.0 0.0.0.255 101.1.1.0 0.0.0.255
Configuring GRE+IPSec to MPLS Service Model

The GRE+IPSec to MPLS configuration is an extension of IPSec to MPLS. This configuration differs from the preceding IPSec to MPLS configuration in that a GRE tunnel transports routing updates between the remote CPE and the IPSec-aggregator/PE instead of IPSec. The configuration shows GRE+IPSec for site-to-site while still supporting client termination.

Before You Begin

The procedures provided here are specific to configuring GRE+IPSec to MPLS and are based on the following assumptions:
1. That the following setup and configuration tasks have already been completed:
   • Setup of the core MPLS network.
   • Setup of the customer VPN.
   • Configuration of the links between the PE and the CE.
   • Customer-specific information is complete.
2. That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies you will use for address management or for user authentication and authorization).

GRE+IPSec to MPLS Configuration Checklist

This section deals with configuring the router to function as both the IPSec Aggregator and the PE router. Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

GRE+IPSec to MPLS Configuration Tasks

Typical GRE+IPSec to MPLS configuration tasks are shown below. Refer to the section titled GRE+IPSec to MPLS Configuration Sample, page 2-24.

**Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 aaa authentication login</td>
<td>Set authentication, authorization, and accounting (AAA) authentication at login.</td>
</tr>
<tr>
<td>Step 2 aaa authorization</td>
<td>Set parameters that restrict user access to a network.</td>
</tr>
</tbody>
</table>

**Task 2: Configure the VRFs**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  ip vrf</td>
<td>Configure a VPN routing and forwarding (VRF) routing table.</td>
</tr>
</tbody>
</table>
Chapter 2 IPSec to MPLS Service Models

Configuring GRE+IPSec to MPLS Service Model

**Task 3: Enable CEF Switching**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 ip cef</td>
<td>Enable Cisco Express Forwarding (CEF).</td>
</tr>
<tr>
<td>Step 2 mpls label protocol {ldp</td>
<td>tdp}</td>
</tr>
<tr>
<td>Step 3 tag-switching ip default-route</td>
<td>Enable the distribution of labels associated with the IP default route.</td>
</tr>
</tbody>
</table>

**Task 4: Configure the Keyring**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during Internet Key Exchange (IKE) authentication.</td>
</tr>
<tr>
<td>Step 2 pre-shared-key {address address [mask]</td>
<td>hostname hostname} \ key key</td>
</tr>
</tbody>
</table>

**Task 5: Configure ISAKMP Policy for Phase 1 Negotiations**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>Step 2 encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>Step 3 authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>

**Task 6: Configure DPD Keepalives**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>
### Task 7: Configure Client Group for Local Authorization

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>`crypto isakmp client configuration group {group-name</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>key name</code> Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>pool (name)</code> Configure a local pool address.</td>
</tr>
</tbody>
</table>

### Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto isakmp profile profile-name</code> Define an ISAKMP profile for a VPN.</td>
<td></td>
</tr>
</tbody>
</table>

### Task 9: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>vrf name</code> Associate the on-demand address pool with a VPN routing and forwarding instance (VRF) name.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>match identity address address [mask] [fvrf]</code> Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

### Task 10: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>client authentication list list-name</code> Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>isakmp authorization list list-name</code> Configure group authorization IKE querying of authentication, authorization, and accounting (AAA) for tunnel attributes in aggressive mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>`client configuration address [initiate</td>
</tr>
</tbody>
</table>

### Task 11: Configure ISAKMP Profile for GRE

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>crypto isakmp profile profile-name</code> Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>
Chapter 2      IPSec to MPLS Service Models

Configuring GRE+IPSec to MPLS Service Model

Note

You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.

Task 12: Configure the Transform Set for Data Encryption

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto IPSec transform-set transform-set-name transform1 [transform2] [transform3] [transform4]</td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

Task 13: Configure IPSec Profile for GRE and Apply Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>crypto IPSec profile name</td>
</tr>
<tr>
<td></td>
<td>Define the IP Security (IPSec) parameters that are to be used for IPSec encryption between two IPSec routers.</td>
</tr>
<tr>
<td>Step 2</td>
<td>set transform-set transform-set-name</td>
</tr>
<tr>
<td></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

Task 14: Configure ISAKMP Client Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>

Task 15: Configure RRI

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse-route [remote-peer]</td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>
Task 16: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [IPSec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>

Task 17: Configure GRE Tunnel to Customer Site

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 interface type</td>
<td>Configure an interface type and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip vrf forwarding vrf-name</td>
<td>Associate a VPN routing and forwarding (VRF) instance with an interface or subinterface.</td>
</tr>
<tr>
<td>Step 3 ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
<tr>
<td>Step 4 tunnel source {ip-address</td>
<td>Set source address for a tunnel interface.</td>
</tr>
<tr>
<td>Step 5 tunnel destination {hostname</td>
<td>Specify the destination for a tunnel interface.</td>
</tr>
</tbody>
</table>

Task 18: Configure IPSec Profile

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tunnel protection ipsec-profile name</td>
<td>Associate a tunnel interface with an IPSec profile.</td>
</tr>
</tbody>
</table>

Task 19: Configure Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 interface type</td>
<td>Configure a loopback interface (emulates an interface that is always up).</td>
</tr>
<tr>
<td>Step 2 ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
<tr>
<td>Step 3 encapsulation dot1q vlan-id [native]</td>
<td>Enable IEEE 802.1Q encapsulation of traffic on a specified subinterface in a virtual LAN (VLAN).</td>
</tr>
<tr>
<td>Step 4 crypto map map-name</td>
<td>Apply a previously defined crypto map set to an interface.</td>
</tr>
</tbody>
</table>

Note: Each interface services one VPN as the IPSec tunnel endpoint for both the sites and clients.
### Task 20: Configure Interface for Tag Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>interface type</code> Configure a loopback interface (emulates an interface that is always up).</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip address ip-address mask</code> Set an IP address for an interface.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>encapsulation dot1q vlan-id [native]</code> Enable IEEE 802.1Q encapsulation of traffic on a specified subinterface in a virtual LAN (VLAN).</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>tag-switching ip</code> Allow label switching of IPv4 packets.</td>
</tr>
</tbody>
</table>

### Task 21: Configure the IGP Used in the Core

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>router ospf process-id</code> Configure an OSPF routing process.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>log-adjacency-changes</code> Generate a log message.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>network ip-address wildcard-mask area area-id</code> Configure the interfaces on which OSPF runs and to define the area ID for those interfaces.</td>
</tr>
</tbody>
</table>

### Task 22: Configure Routing Protocol Across GRE Tunnel

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>router rip</code> Configure the Routing Information Protocol (RIP) routing process.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`version {1</td>
</tr>
</tbody>
</table>

### Task 23: Configure Address Family Definition per VRF

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>address-family</code> Enter the address family submode for configuring routing protocols such as BGP, RIP, and static routing.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`version {1</td>
</tr>
</tbody>
</table>

### Task 24: Redistribute VPN Routes Learned Through BGP

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>redistribute protocol</code> Redistribute routes from one routing domain into another routing domain.</td>
</tr>
</tbody>
</table>
### Task 25: Configure BGP to Carry VPN Routes

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>router bgp as-number</td>
</tr>
<tr>
<td>Step 2</td>
<td>no synchronization</td>
</tr>
<tr>
<td>Step 3</td>
<td>bgp log-neighbor-changes</td>
</tr>
<tr>
<td>Step 4</td>
<td>neighbor {ip-address</td>
</tr>
<tr>
<td>Step 5</td>
<td>no auto-summary</td>
</tr>
</tbody>
</table>

### Task 26: Configure Peers to Receive VPNv4 Routes

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>address-family</td>
</tr>
<tr>
<td>Step 2</td>
<td>neighbor {ip-address</td>
</tr>
<tr>
<td>Step 3</td>
<td>no auto-summary</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit-address-family</td>
</tr>
</tbody>
</table>

### Task 27: Configure IPv4 Address-Family for Each VPN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>address-family</td>
</tr>
</tbody>
</table>
## Chapter 2      IPSec to MPLS Service Models

### Configuring GRE+IPSec to MPLS Service Model

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 28: Redistribute Routes Learned Over GRE Into VPN</td>
<td></td>
</tr>
<tr>
<td>Step 1</td>
<td>redistribute protocol</td>
</tr>
<tr>
<td>Step 2</td>
<td>no auto-summary</td>
</tr>
<tr>
<td>Step 3</td>
<td>no synchronization</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit-address-family</td>
</tr>
</tbody>
</table>

**Command Purpose**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>redistribute protocol</td>
</tr>
<tr>
<td>Step 2</td>
<td>no auto-summary</td>
</tr>
<tr>
<td>Step 3</td>
<td>no synchronization</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit-address-family</td>
</tr>
</tbody>
</table>

### Task 29: Configure Pool to Distribute IP Addresses to VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>ip local pool {default</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip classless</td>
</tr>
</tbody>
</table>

**Command Purpose**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configure a local pool of IP addresses to be used when a remote peer connects to a point-to-point interface.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Configure the router to send any packets it receives that are destined for a subnet of a network that has no network default route to the best supernet route possible.</td>
</tr>
</tbody>
</table>

### Task 30: Configure Global Default Route

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip route network-number network-mask {ip-address</td>
<td>interface-name} [distance] [name name]</td>
</tr>
</tbody>
</table>
**GRE+IPSec to MPLS Configuration Sample**

Figure 2-2 illustrates the following GRE+IPSec IPSec to MPLS configuration.

![Figure 2-2: GRE+IPSec IPSec to MPLS configuration](image)

Building configuration...

```plaintext
Current configuration : 4093 bytes
!
version 12.2
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname pe2
username cisco password 0 cisco
aaa new-model
!
Step 1 Configure authentication and authorization lists for clients to RADIUS.

aaa authentication login localist local
aaa authorization network localist local
aaa session-id common
ip subnet-zero
no ip domain lookup
!
Step 2 Configure VRFs.

ip vrf vpn1
rd 100:1
route-target export 100:1
route-target import 100:1
!
Step 3 Configure CEF.

ip cef
mpls label protocol ldp
mpls ldp logging neighbor-changes
tag-switching ip default-route
```
Step 4  Configure Keyring/VPN.
  
  crypto keyring gre
  
  pre-shared-key address 20.1.2.1 key cisco123

Step 5  Configure the ISAKMP policy for Phase 1 negotiations.
  
  crypto isakmp policy 1
  
  authentication pre-share
group 2

  crypto isakmp policy 2
  
  encr 3des
  
  authentication pre-share

Step 6  Configure the DPD keepalives.
  
  crypto isakmp keepalive 30
  
  crypto isakmp xauth timeout 30

Step 7  Configure client group for local authorization.
  
  crypto isakmp client configuration group ezvpn
  
  key cisco123
  
  pool hw-pool

Step 8  Configure ISAKMP profile for VPN clients.
  
  crypto isakmp profile vpn1-ez

Step 9  Configure dynamic VRF association for VPN clients.
  
  vrf vpn1
  
  match identity group ezvpn

Step 10 Configure XAUTH, group authorization, and mode-config.
  
  client authentication list localist
  
  isakmp authorization list localist
  
  client configuration address respond

Step 11 Configure ISAKMP profile for GRE.
  
  crypto isakmp profile gre
  
  keyring gre
  
  match identity address 20.1.2.1 255.255.255.255

Step 12 Configure the transform set.
  
  crypto IPSec transform-set tset1 esp-3des esp-sha-hmac

Step 13 Configure IPSec profile for GRE and apply transform set.
  
  crypto IPSec profile gre
  
  set transform-set tset1
  
  set isakmp-profile gre
  
  crypto dynamic-map dyna 1
  
  set security-association idle-time 3600
  
  set transform-set tset1

Step 14 Configure ISAKMP client profile reference.
  
  set isakmp-profile vpn1-ez

Step 15 Configure RRI.
**Step 16** Configure dynamic crypto map for clients.
```
crypto map vpn 1000 IPSec-isakmp dynamic dyna
```
```
interface Loopback0
  ip address 99.1.1.2 255.255.255.255
```

**Step 17** Configure encrypted GRE tunnel to customer site.
```
interface Tunnel1
  ip vrf forwarding vpn1
  ip address 12.1.1.1 255.255.255.252
  tunnel source 30.1.1.3
  tunnel destination 20.1.2.1
```

**Step 18** Configure IPSec profile.
```
tunnel protection IPSec profile gre
```
```
interface FastEthernet2/0
  no ip address
  duplex auto
  speed auto
```

**Step 19** Configure Internet facing interface and corresponding crypto maps.
```
interface FastEthernet2/0.1
  encapsulation dot1Q 10
  ip address 30.1.1.3 255.255.255.0
  crypto map vpn
```
```
interface FastEthernet2/1
  no ip address
  duplex auto
  speed auto
```

**Step 20** Configure interface for tag switching.
```
interface FastEthernet2/1.1
  encapsulation dot1Q 10
  ip address 125.1.10.3 255.255.255.0
  tag-switching ip
```

**Step 21** Configure IGP used in core.
```
router ospf 1
  log-adjacency-changes
  network 99.1.1.2 0.0.0.0 area 0
  network 125.1.10.0 0.0.0.255 area 0
```

**Step 22** Configure routing protocol across the GRE tunnel.
```
router rip
  version 2
```

**Step 23** Configure address family definition per VRF.
```
address-family ipv4 vrf vpn1
  version 2
```

**Step 24** Redistribute VPN routes learned through BGP.
```
redistribute bgp 100 metric 1
  network 12.0.0.0
  no auto-summary
exit-address-family

Step 25  Configure BGP to carry VPN routes.
router bgp 100
   no synchronization
   bgp log-neighbor-changes
   neighbor 99.1.1.3 remote-as 100
   neighbor 99.1.1.3 update-source Loopback0
   no auto-summary

Step 26  Configure peers to receive VPNv4 routes.
address-family vpnv4
   neighbor 99.1.1.3 activate
   neighbor 99.1.1.3 send-community both
   no auto-summary
   exit-address-family

Step 27  Configure Ipv4 address family for each VPN.
address-family ipv4 vrf vpn1
   redistribute static

Step 28  Redistribute routes learned over GRE into VPN.
redistribute rip
   no auto-summary
   no synchronization
   exit-address-family

Step 29  Configure the pool to distribute IP addresses to VPN clients.
ip local pool hw-pool 192.168.2.1 192.168.2.254
ip classless

Step 30  Configure global default route.
ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1
CHAPTER 3

IPSec to L2VPN Service Model

This chapter describes how to configure the IPSec to L2VPN service model for the Cisco Network-Based IPSec VPN Release 1.5.

Configuring the IPSec to L2VPN Service Model

The IPSec to L2VPN model is very similar to the IPSec to MPLS topology, except the service provider has an L2 core instead of an MPLS core. The L2 core can be Frame Relay, ATM, 802.1q, or wireless.

This configuration enables a Layer 2 service provider to extend secured access service beyond its core into the internet. As in the IPSec to MPLS model, the sessions are terminated on the IPSec Aggregator. Using the Multi-VRF CE feature, users are mapped into an L2 infrastructure.

At an L3 level, the IPSec aggregator connects directly to the customer site that has L2 service. The service provider does not need to address the customer routing issue in its core. The IPSec aggregator and the L2 customer site can use either static routes or a dynamic routing protocol to establish end-to-end connectivity.

Before You Begin

The procedures provided here are specific to configuring IPSec to L2VPN and are based on the following assumptions:

1. That the following setup and configuration tasks have already been completed:
   - Setup of the core MPLS network
   - Setup of the customer VPN
   - Configuration of the links between the PE and the CE
   - Customer-specific information is complete

   • That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies to use for address management or for user authentication and authorization).

IPSec to L2VPN Configuration Checklist

This section deals with configuring the router to function as the IPSec aggregator.
Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click highlighted text to view details on the procedure.

**IPSec to L2VPN Configuration Tasks**

Typical IPSec to L2VPN configuration tasks are shown below. See IPSec to L2VPN Configuration Sample, page 3-9.
## Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa authentication login</td>
<td>Set authentication, authorization, and accounting (AAA) authentication at login.</td>
</tr>
<tr>
<td>aaa authorization</td>
<td>Set parameters that restrict user access to a network.</td>
</tr>
</tbody>
</table>

## Task 2: Configure the VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip vrf</td>
<td>Configure a VPN routing and forwarding (VRF) routing table.</td>
</tr>
<tr>
<td>rd route-distinguisher</td>
<td>Create routing and forwarding tables for a VRF.</td>
</tr>
</tbody>
</table>

## Task 3: Enable CEF Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip cef</td>
<td>Enable Cisco Express Forwarding (CEF).</td>
</tr>
<tr>
<td>tag-switching ip default-route</td>
<td>Enable the distribution of labels associated with the IP default route.</td>
</tr>
</tbody>
</table>

## Task 4: Configure the Keyring

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during Internet Key Exchange (IKE) authentication.</td>
</tr>
<tr>
<td>pre-shared-key [address address [mask]</td>
<td>Configure the addressed preshared key to be used during IKE) authentication.</td>
</tr>
<tr>
<td>hostname hostname] key key</td>
<td></td>
</tr>
</tbody>
</table>

## Task 5: Configure ISAKMP Policy

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>
Task 6: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

Task 7: Configure Client Group for Local Authorization

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>crypto isakmp client configuration group {group-name</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>key name</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>pool (name)</td>
</tr>
</tbody>
</table>

Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Task 9: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>vrf name</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>keyring keyring-name</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>match identity address address [mask] [fvr]</td>
</tr>
</tbody>
</table>

Task 10: Configure ISAKMP Profile for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

**Note**

You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.
Task 11: Configure Dynamic VRF Association for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF VRF name.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

Task 12: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>isakmp authorization list list-name</td>
<td>Configure group authorization IKE querying of AAA for tunnel attributes in aggressive mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>client configuration address [initiate</td>
<td>respond]</td>
</tr>
</tbody>
</table>

Task 13: Configure the Transform Set for Data Encryption

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto IPSec transform-set transform-set-name transform1 [transform2] [transform3] [transform4]</td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

Task 14: Configure Dynamic Crypto Map and Apply Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>

</tbody>
</table>
IPSec to L2VPN Configuration Sample

Figure 3-1 illustrates the following IPSec to MPLS configuration.

![Figure 3-1 IPSec to L2VPN Configuration]

pe1#sh run
Building configuration...

Current configuration : 3874 bytes
!
version 12.2
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption

hostname pe1
enable password cisco
!
username cisco password 0 cisco
aaa new-model

Step 1 Configure authentication and authorization list for clients to RADIUS.

aaa authentication login localist local
aaa authorization network localist local
aaa session-id common
ip subnet-zero
no ip domain lookup

Step 2 Configure VRFs.

ip vrf vpn1
   rd 100:1

Step 3 Enable CEF switching.

ip cef
tag-switching ip default-route

Step 4 Configure Keyring.

crypto keyring vpn1
Step 5 Configure ISAKMP policy.

```plaintext
crypto isakmp policy 1
  authentication pre-share
  group 2

crypto isakmp policy 2
  encr 3des
  authentication pre-share
```

Step 6 Configure DPD keepalives.

```plaintext
crypto isakmp keepalive 30

crypto isakmp xauth timeout 30
```

Step 7 Configure client group for local authorization.

```plaintext
crypto isakmp client configuration group ezvpn
  key cisco123
  pool hw-pool
```

Step 8 Configure ISAKMP profile for VPN sites.

```plaintext
crypto isakmp profile vpn1
```

Step 9 Configure dynamic VRF association.

```plaintext
vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255
  match identity address 40.1.1.2 255.255.255.255
```

Step 10 Configure ISAKMP profile for VPN clients.

```plaintext
crypto isakmp profile vpn1-ez
```

Step 11 Configure dynamic VRF association.

```plaintext
vrf vpn1
  match identity group ezvpn
```

Step 12 Configure XAUTH, group authorization, and mode-config.

```plaintext
client authentication list localist
isakmp authorization list localist
client configuration address respond
```

Step 13 Configure the transform set

```plaintext
crypto IPSec transform-set tset1 esp-3des esp-sha-hmac
```

Step 14 Configure dynamic crypto map.

```plaintext
crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1
```

Step 15 Configure ISAKMP client profile reference.

```plaintext
set isakmp-profile vpn1-ez
```

Step 16 Configure RRI.
reverse-route

**Step 17** Configure static crypto map for a site.
```
crypto map vpn 10 IPSec-isakmp
  set peer 20.1.1.1
  set transform-set tset1
```

**Step 18** Configure ISAKMP site profile reference.
```
set isakmp-profile vpn1
  match address 101
```

**Step 19** Configure dynamic crypto map for clients.
```
crypto map vpn 1000 IPSec-isakmp dynamic dyna
  interface FastEthernet2/0
    no ip address
    duplex auto
    speed auto
```

**Step 20** Configure Internet facing interface and corresponding crypto maps.
```
interface FastEthernet2/0
  encapsulation dot1Q 10
  ip address 30.1.1.2 255.255.255.0
  crypto map vpn
    interface ATM6/0
      no ip address
      no atm ilmi-keepalive
```

**Step 21** Configure the interface for L2VPN.
```
interface ATM6/0 point-to-point
  ip vrf forwarding vpn1
  ip address 125.1.30.1 255.255.255.252
  pvc 0/100
```

**Step 22** Configure the pool to distribute IP addresses to VPN clients.
```
ip local pool hw-pool 192.168.1.1 192.168.1.254
  ip classless
```

**Step 23** Configure static routes for public IP addresses.
```
ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1
```

**Step 24** Configure static VPN routes if not using an IGP within the VPN.
```
ip route vrf vpn1 101.1.1.0 255.255.255.0 30.1.1.1 global
  ip route vrf vpn1 101.1.2.0 255.255.255.0 125.1.10.2
  no ip http server
  no ip http secure-server
```

**Step 25** Configure the crypto access list to define traffic to be encrypted.
```
access-list 101 permit ip 101.1.2.0 0.0.0.255 101.1.1.0 0.0.0.255
```

---

**Note** You can run VRF aware routing protocols like EBPG, RIP, STATIC and OSPF between the routers.
IPSec to IPSec Service Model

This chapter describes how to configure the IPSec to IPSec service model for the Cisco Network-Based IPSec VPN Release 1.5.

Configuring IPSec to IPSec Service Model

In this model, the IPSec Aggregator aggregates any remote sites/clients and then forwards the information to a headend enterprise VPN device. Since traffic is going over an open IP network, IPSec provides the necessary encryption over the IP backbone. This also permits private overlapping IP addressing schemes between enterprises.

Before You Begin

The procedures provided here are specific to configuring IPSec to IPSec with one box and are based on the following assumptions:

1. That the following setup and configuration tasks have already been completed:
   - Setup of the core IP/MPLS network.
   - Setup of the customer VPN
   - Configuration of the links between the PE and the CE.
   - Customer-specific information is complete.

2. That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies you will use for address management or for user authentication and authorization).

IPSec to IPSec Configuration Checklist

This section deals with configuring the router to function as an IPSec aggregator.

Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

**IPSec to IPSec Configuration Tasks**

Typical IPSec to IPSec configuration tasks are shown below. See **IPSec to IPSec Configuration Sample**, page 4-9.
Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>aaa authentication login</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa authorization</td>
</tr>
</tbody>
</table>

Task 2: Configure the VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>ip vrf</td>
</tr>
<tr>
<td>Step 2</td>
<td>rd route-distinguisher</td>
</tr>
</tbody>
</table>

Task 3: Configure CEF Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>ip cef</td>
</tr>
<tr>
<td>Step 2</td>
<td>tag-switching ip default-route</td>
</tr>
</tbody>
</table>

Task 4: Configure the Keyring/VPN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>crypto keyring keyring-name [vrf fvrf]</td>
</tr>
<tr>
<td>Step 2</td>
<td>pre-shared-key {address address [mask]</td>
</tr>
</tbody>
</table>

Task 5: Configure ISAKMP Policy for Phase 1 Negotiations

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>crypto isakmp policy priority</td>
</tr>
<tr>
<td>Step 2</td>
<td>encryption {des</td>
</tr>
<tr>
<td>Step 3</td>
<td>authentication {rsa-sig</td>
</tr>
</tbody>
</table>
Chapter 4   IPSec to IPSec Service Model

Task 6: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

Task 7: Configure Client Group Definition for Local Authorization

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>crypto isakmp client configuration group {group-name</td>
<td>default}</td>
</tr>
<tr>
<td>2</td>
<td>key name</td>
<td>Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>3</td>
<td>pool (name)</td>
<td>Configure a local pool address.</td>
</tr>
</tbody>
</table>

Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Task 9: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name.</td>
</tr>
<tr>
<td>2</td>
<td>keyring keyring-name</td>
<td>Associate a keyring with an ISAKMP profile.</td>
</tr>
<tr>
<td>3</td>
<td>match identity address address [mask] [fvr]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

Task 10: Configure ISAKMP Profile for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Note: You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.
Task 11: Configure Dynamic VRF Association for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name.</td>
</tr>
<tr>
<td>match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

Task 12: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration</td>
</tr>
<tr>
<td>isakmp authorization list list-name</td>
<td>Configure group authorization IKE querying of AAA for tunnel attributes in aggressive mode.</td>
</tr>
<tr>
<td>client configuration address [initiate</td>
<td>respond]</td>
</tr>
</tbody>
</table>

Task 13: Configure the Transform Set for Data Encryption

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto IPSec transform-set transform-set-name transform1 [transform2] [transform3] [transform4]</td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

Task 14: Configure Dynamic Crypto Map and Apply Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto dynamic-map dynamic-map-name dynamic-seq-num</td>
<td>Create a dynamic crypto map entry and enter the crypto map configuration command mode.</td>
</tr>
<tr>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

Task 15: Configure ISAKMP Client Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>
# Task 16: Configure RRI

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse-route [remote-peer]</td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>

# Task 17: Configure Static Crypto Map for Sites

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>crypto map map-name seq-num [IPSec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td>2</td>
<td>set peer {hostname</td>
<td>ip-address}</td>
</tr>
<tr>
<td>3</td>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

# Task 18: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name reference.</td>
</tr>
<tr>
<td>2</td>
<td>match identity address address [mask] [fvr]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular isakmp profile.</td>
</tr>
</tbody>
</table>

# Task 19: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [IPSec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>

# Task 20: Configure Crypto Map to HQ

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>crypto map map-name seq-num [IPSec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td>2</td>
<td>set peer {hostname</td>
<td>ip-address}</td>
</tr>
<tr>
<td>3</td>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>
Chapter 4      IPSec to IPSec Service Model

Task 21: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>set isakmp-profile profile-name</td>
</tr>
<tr>
<td>Step 2</td>
<td>match identity address address [mask] [fvrf]</td>
</tr>
</tbody>
</table>

Task 22: Connect Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface type</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip address ip-address mask</td>
</tr>
<tr>
<td>Step 3</td>
<td>encapsulation dot1q vlan-id [native]</td>
</tr>
<tr>
<td>Step 4</td>
<td>crypto map map-name</td>
</tr>
</tbody>
</table>

Note  Each interface services one VPN as the IPSec tunnel endpoint for both the sites and clients.

Task 23: Apply Crypto Map towards HQ

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface type</td>
</tr>
<tr>
<td>Step 1</td>
<td>encapsulation dot1q vlan-id [native]</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip address ip-address mask</td>
</tr>
<tr>
<td>Step 3</td>
<td>crypto map map-name</td>
</tr>
</tbody>
</table>

Task 24: Configure the Interior Gateway Protocol (IGP) Used in the Core

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>log-adjacency-changes</td>
</tr>
<tr>
<td>Step 3</td>
<td>network ip-address wildcard-mask area area-id</td>
</tr>
</tbody>
</table>
Task 25: Configure the Pools to Distribute IP Addresses to VPN Clients

Command | Purpose
--- | ---
**Step 1**
ip local pool {default | pool-name} low-ip-address [high-ip-address] | Configure a local pool of IP addresses to be used when a remote peer connects to a point-to-point interface.

**Step 2**
ip classless | Configure the router to send any packets it receives that are destined for a subnet of a network that has no network default route to the best supernet route possible.

Task 26: Configure Global Default Route

Command | Purpose
--- | ---
ip route network-number network-mask {ip-address | interface-name} [distance] [name name] | Establish static routes and define the next hop for large-scale dial-out.

Task 27: Configure Static VPN Routes

ip route vrf vrf-name prefix mask [next-hop-address] [interface {interface-number}] [global] [distance] [permanent] [tag tag] | Establish static routes for a VRF instance.

Task 28: Configure the Crypto ACL to Define Traffic to be Encrypted towards Sites

access-list access-list-number {deny | permit} source [source-wildcard] [log] | Configure a standard IP access list.

Task 29: Configure the Crypto ACL to Define Traffic to be Encrypted towards HQ

access-list access-list-number {deny | permit} source [source-wildcard] [log] | Configure a standard IP access list.
**IPSec to IPSec Configuration Sample**

Figure 4-1 illustrates the following IPSec to IPSec configuration.

**Figure 4-1 IPSec to IPSec Configuration**

```
Step 1  Configure authentication and authorization lists for clients to RADIUS.
        aaa authentication login localist local
        aaa authorization network localist local
        aaa session-id common
        ip subnet-zero
        no ip domain lookup

Step 2  Configure the VRFs.
        ip vrf vpn1
        rd 100:1

Step 3  Enable CEF switching.
        ip cef
        mpls ldp logging neighbor-changes
tag-switching ip default-route

Step 4  Configure Keyring.
```
Step 5 Configure the ISAKMP policy for Phase 1 negotiations.

```plaintext
crypto isakmp policy 1
  authentication pre-share
group 2

crypto isakmp policy 2
  encr 3des
  authentication pre-share
```

Step 6 Configure DPD keepalives.

```plaintext
crypto isakmp keepalive 30
crypto isakmp xauth timeout 30
```

Step 7 Configure client group for local authorization.

```plaintext
crypto isakmp client configuration group ezvpn
  key cisco123
  pool hw-pool
```

Step 8 Configure ISAKMP profile for VPN sites.

```plaintext
crypto isakmp profile vpn1
```

Step 9 Configure dynamic VRF association.

```plaintext
vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255
  match identity address 40.1.1.2 255.255.255.255
```

Step 10 Configure ISAKMP profile for VPN clients.

```plaintext
crypto isakmp profile vpn1-ez
```

Step 11 Configure dynamic VRF association.

```plaintext
vrf vpn1
  keyring vpn1
  match identity group ezvpn
```

Step 12 Configure XAUTH, group authorization, and mode-config.

```plaintext
client authentication list localist
isakmp authorization list localist
client configuration address respond
```

Step 13 Configure transform set for data encryption.

```plaintext
crypto IPSec transform-set tset1 esp-3des esp-sha-hmac
```

Step 14 Configure dynamic crypto map and apply transform set.

```plaintext
crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1
```
**Step 15** Configure ISAKMP client profile reference.

```
set isakmp-profile vpn1-ez
```

**Step 16** Configure client RRI.

```
reverse-route
```

**Step 17** Configure static map for a site.

```
crypto map vpn 10 IPSec-isakmp
set peer 20.1.1.1
set transform-set tset1
```

**Step 18** Configure ISAKMP site profile reference.

```
set isakmp-profile vpn1
match address 101
```

**Step 19** Configure dynamic crypto map for clients.

```
crypto map vpn 1000 IPSec-isakmp dynamic dyna
```

**Step 20** Configure crypto map towards HQ.

```
crypto map vpn_out 10 IPSec-isakmp
set peer 40.1.1.2
set transform-set tset1
```

**Step 21** Configure ISAKMP site profile reference.

```
set isakmp-profile vpn1
match address 151

interface FastEthernet2/0
no ip address
duplex auto
speed auto
```

**Step 22** Configure Internet-facing interface and corresponding crypto maps.

```
interface FastEthernet2/0.1
encapsulation dot1Q 10
ip address 30.1.1.2 255.255.255.0
crypto map vpn

interface FastEthernet2/1
no ip address
duplex auto
speed auto
```

**Step 23** Apply crypto maps towards HQ.

```
interface FastEthernet2/1.1
encapsulation dot1Q 10
ip address 125.1.10.2 255.255.255.0
crypto map vpn_out
```

**Step 24** Configure the IGP used in the core.

```
router ospf 1
log-adjacency-changes
network 125.1.10.0 0.0.0.255 area 0
```

**Step 25** Configure the pool to distribute IP addresses to VPN clients.

```
ip local pool hw-pool 192.168.1.1 192.168.1.254
```
Step 26  Configure global default route.
        ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1

Step 27  Configure static VPN routes.
        ip route vrf vpn1 101.1.1.0 255.255.255.0 30.1.1.1 global
        ip route vrf vpn1 101.1.2.0 255.255.255.0 125.1.10.1 global

Step 28  Configure the crypto access list defining traffic to be encrypted toward the sites.
        access-list 101 permit ip 101.1.2.0 0.0.0.255 101.1.1.0 0.0.0.255

Step 29  Configure the Crypto access list defining traffic to be encrypted towards HQ.
        access-list 151 permit ip 101.1.1.0 0.0.0.255 101.1.2.0 0.0.0.255
IPSec to GRE Service Models

This chapter describes how to configure the IPSec to GRE, IPSec to GRE+IPSec, and the PE to PE Encryption service models for the Cisco Network-Based IPSec VPN Release 1.5.

Configuring the IPSec to GRE Service Model

The IPSec to GRE model is useful when the service provider has an IP backbone but still wants to provide VPN-like functionality. Remote sites and clients terminate as in the IPSec to IPSec model, however they are then encapsulated into GRE and forwarded to a customer headend router that is the other endpoint for GRE.

GRE also lets you run a routing protocol on per-VRF basis with the headend customer router. The GRE tunnels towards the headend can also be encrypted. The packets traveling from remote clients and sites are decrypted, routed to the GRE tunnel interface where they are encapsulated with the GRE header, and then the GRE packet is encrypted by IPSec to provide secure connectivity across the IP backbone.

Before You Begin

The procedures provided here are specific to configuring IPSec to IPSec with one box and are based on the following assumptions:

1. That the following setup and configuration tasks have already been completed:
   - Setup of the core IP/MPLS network.
   - Setup of the customer VPN
   - Configuration of the links between the PE and the CE.
   - Customer-specific information is complete.
   - That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies you will use for address management or for user authentication and authorization).

IPSec to GRE Integration Configuration Checklist

This section deals with configuring the router to function as the IPSec aggregator.

Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

**IPSec to GRE Configuration Task List**

Typical IPSec to GRE configuration tasks are shown below. See [IPSec to GRE Configuration Sample](page 5-9), page 5-9.
Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 aaa authentication login</td>
<td>Set authentication, authorization, and accounting (AAA) authentication at login.</td>
</tr>
<tr>
<td>Step 2 aaa authorization</td>
<td>Set parameters that restrict user access to a network.</td>
</tr>
</tbody>
</table>

Task 2: Configure the VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 ip vrf</td>
<td>Configure a VPN routing and forwarding (VRF) routing table.</td>
</tr>
<tr>
<td>Step 2 rd route-distinguisher</td>
<td>Create routing and forwarding tables for a VRF.</td>
</tr>
</tbody>
</table>

Task 3: Enable CEF Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip cef</td>
<td>Enable CEF switching.</td>
</tr>
</tbody>
</table>

Task 4: Configure the Keyring

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during Internet Key Exchange (IKE) authentication.</td>
</tr>
<tr>
<td>Step 2 pre-shared-key [address address [mask]</td>
<td>hostname] key key</td>
</tr>
</tbody>
</table>

Task 5: Configure ISAKMP Policy for Phase 1 Negotiations

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>Step 2 encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>Step 3 authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>
## Task 6: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

## Task 7: Configure Client Group Definition for Local Authorization

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp client configuration group {group-name</td>
<td>default}</td>
</tr>
<tr>
<td>Step 2 key name</td>
<td>Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>Step 3 pool (name)</td>
<td>Configure a local pool address.</td>
</tr>
</tbody>
</table>

## Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

## Task 9: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 vrf name</td>
<td>Associate the on-demand address pool with a VRF name.</td>
</tr>
<tr>
<td>Step 2 keyring keyring-name</td>
<td>Associate a keyring with an ISAKMP profile.</td>
</tr>
<tr>
<td>Step 3 match identity address address [mask] [fvr]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

## Task 10: Configure ISAKMP Profile for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

### Note

You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.
### Task 11: Configure Dynamic VRF Association for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name. See vrf for information on using this command.</td>
</tr>
<tr>
<td>match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

### Task 12: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration</td>
</tr>
<tr>
<td>isakmp authorization list list-name</td>
<td>Configure group authorization IKE querying of AAA for tunnel attributes in aggressive mode.</td>
</tr>
<tr>
<td>client configuration address [initiate</td>
<td>respond] Configure IKE mode configuration (Mode-Config).</td>
</tr>
</tbody>
</table>

### Task 13: Configure the Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto ipsec transform-set transform-set-name transform1 [transform2] [transform3] [transform4]</td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

### Task 14: Configure Dynamic Crypto Map and Apply Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto dynamic-map dynamic-map-name dynamic-seq-num</td>
<td>Create a dynamic crypto map entry and enter the crypto map configuration command mode.</td>
</tr>
<tr>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

### Task 15: Configure ISAKMP Client Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>
Task 16: Configure Client RRI

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse-route [remote-peer]</td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>

Task 17: Configure Static Crypto Map for Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto map map-name seq-num [ipsec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td>Step 2 set peer {hostname</td>
<td>ip-address}</td>
</tr>
<tr>
<td>Step 3 set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

Task 18: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name reference.</td>
</tr>
<tr>
<td>Step 2 match identity address address [mask] [fvrf]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

Task 19: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [ipsec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>

Task 20: Configure GRE Tunnel to HQ

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 interface type</td>
<td>Configure an interface type and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip vrf forwarding vrf-name</td>
<td>Associate a VRF instance with an interface or subinterface.</td>
</tr>
<tr>
<td>Step 3 ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
</tbody>
</table>
Chapter 5  IPSec to GRE Service Models

Configuring the IPSec to GRE Service Model

Task 21: Configure Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface type</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip address ip-address mask</td>
</tr>
<tr>
<td>Step 3</td>
<td>encapsulation dot1q vlan-id [native]</td>
</tr>
<tr>
<td>Step 4</td>
<td>crypto map map-name</td>
</tr>
</tbody>
</table>

Note: Each interface services one VPN as the IPSec tunnel endpoint for both the sites and clients.

Task 22: Configure the IGP Used In Core

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>log-adjacency-changes</td>
</tr>
<tr>
<td>Step 3</td>
<td>network ip-address wildcard-mask area area-id</td>
</tr>
</tbody>
</table>

Task 23: Configure Pool to Distribute IP Addresses to VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip local pool {default</td>
<td>pool-name low-ip-address [high-ip-address]}</td>
</tr>
</tbody>
</table>

Task 24: Configure the Global Default Route

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip route network-number network-mask {ip-address</td>
<td>interface-name} [distance] [name name]</td>
</tr>
</tbody>
</table>
### Task 25: Configure Static VPN Routes if not using IGP within the VPN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip route vrf vrf-name prefix mask [next-hop-address] [interface {interface-number}] [global] [distance] [permanent] [tag tag]</code></td>
<td>Establish static routes for a VRF instance.</td>
</tr>
</tbody>
</table>

### Task 26: Configure the Crypto Access List to Define Traffic to be Encrypted

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number (deny</td>
<td>permit) source [source-wildcard] [log]`</td>
</tr>
</tbody>
</table>
**IPSec to GRE Configuration Sample**

Figure 5-1 illustrates the following IPSec to GRE configuration.

**Figure 5-1   IPSec to GRE Configuration**

```
pe1#sh run
Building configuration...

Current configuration : 3783 bytes
!
version 12.2
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname pe1
enable password cisco
!
username cisco password 0 cisco
aaa new-model

---

**Step 1** Configure authentication and authorization lists for clients to RADIUS.

```
aaa authentication login localist local
aaa authorization network localist local
aaa session-id common
ip subnet-zero
no ip domain lookup
```

**Step 2** Configure VRFs.

```
ip vrf vpn1
rd 100:1
```

**Step 3** Enable CEF switching.

```
ip cef
```

**Step 4** Configure keyring.

```
crypto keyring vpn1
```
Step 5 Configure ISAKMP policy for Phase 1 negotiations.

crypto isakmp policy 1
  authentication pre-share
  group 2

crypto isakmp policy 2
  encr 3des
  authentication pre-share

Step 6 Configure DPD keepalives.

crypto isakmp keepalive 30

crypto isakmp xauth timeout 30

Step 7 Configure client group for local authorization.

crypto isakmp client configuration group ezvpn
  key cisco123
  pool hw-pool

Step 8 Configure ISAKMP profile for VPN sites.

crypto isakmp profile vpn1

Step 9 Configure dynamic VRF association for sites.

  vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255

Step 10 Configure ISAKMP profile for VPN clients.

crypto isakmp profile vpn1-ez

Step 11 Configure dynamic VRF association for VPN clients.

  vrf vpn1
  match identity group ezvpn

Step 12 Configure XAUTH, group authorization, and mode-config.

  client authentication list localist
  isakmp authorization list localist
  client configuration address respond

Step 13 Configure the transform set.

crypto ipsec transform-set tset1 esp-3des esp-sha-hmac

Step 14 Configure dynamic crypto map and apply transform set.

  crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1

Step 15 Configure ISAKMP client profile reference.
Chapter 5      IPSec to GRE Service Models

Configuring the IPSec to GRE Service Model

Step 16 Configure client RRI.
   reverse-route

Step 17 Configure static map for a site.
   crypto map vpn 10 ipsec-isakmp
   set peer 20.1.1.1
   set transform-set tset1

Step 18 Configure ISAKMP site profile reference.
   set isakmp-profile vpn1
   match address 101

Step 19 Configure dynamic crypto map for clients.
   crypto map vpn 1000 ipsec-isakmp dynamic dyna

Step 20 Configure GRE tunnel to HQ.
   interface Tunnel1
   ip vrf forwarding vpn1
   ip address 11.1.1.1 255.255.255.0
   tunnel source 125.1.10.2
   tunnel destination 40.1.1.2
   !
   interface FastEthernet2/0
   no ip address
   duplex auto
   speed auto

Step 21 Configure Internet-facing interface and corresponding crypto maps.
   interface FastEthernet2/0.1
   encapsulation dot1Q 10
   ip address 30.1.1.2 255.255.255.0
   crypto map vpn
   !
   interface FastEthernet2/1
   no ip address
   duplex auto
   speed auto
   !
   interface FastEthernet2/1.1
   encapsulation dot1Q 10
   ip address 125.1.10.2 255.255.255.0

Step 22 Configure the IGP used in the core.
   router ospf 1
   log-adjacency-changes
   network 125.1.10.0 0.0.0.255 area 0

Step 23 Configure the pool to distribute IP addresses to VPN clients.
   ip local pool hw-pool 192.168.1.1 192.168.1.254
   ip classless

Step 24 Configure global default route.
   ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1

Step 25 Configure static VPN routes if not using an IGP within the VPN.
Configuring IPSec to GRE+IPSec Service Model

The difference between the IPSec to GRE configuration and the IPSec to GRE+IPSec configuration is that in the IPSec to GRE configuration the GRE tunnel is not encrypted and in the IPSec to GRE+IPSec configuration the GRE tunnel is encrypted.

Before You Begin

The procedures provided here are specific to configuring IPSec to GRE+IPSec and are based on the following assumptions:
- That the following setup and configuration tasks have already been completed:
  - Setup of the core MPLS network.
  - Setup of the customer VPN
  - Configuration of the links between the PE and the CE.
  - Customer-specific information is complete.
- That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies you will use for address management or for user authentication and authorization).

IPSec to GRE+IPSec Integration Configuration Checklist

This section deals with configuring the router to function as both the IPSec aggregator and the PE router. Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

IPSec to GRE+IPSec Configuration Tasks

Typical IPSec to GRE+IPSec configuration tasks are shown below. See IPSec to GRE+IPSec Configuration Sample, page 5-20.

**Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>aaa authentication login</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa authorization</td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa session-id [common</td>
</tr>
</tbody>
</table>
Task 2: Configure the VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 ip vrf</td>
<td>Configure a VRF routing table.</td>
</tr>
<tr>
<td>Step 2 rd route-distinguisher</td>
<td>Create routing and forwarding tables for a VRF.</td>
</tr>
</tbody>
</table>

Task 3: Configure the Keyring

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during IKE authentication.</td>
</tr>
<tr>
<td>Step 2 pre-shared-key {address address [mask]</td>
<td>Configure the addressed preshared key to be used during IKE authentication.</td>
</tr>
<tr>
<td>hostname hostname} key key</td>
<td></td>
</tr>
</tbody>
</table>

Task 4: Configure ISAKMP Policy for Phase 1 Negotiations

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>Step 2 encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>Step 3 authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>

Task 5: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

Task 6: Configure Client Group Definition for Local Authorization

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto isakmp client configuration group {group-name</td>
<td>default}</td>
</tr>
<tr>
<td>Step 2 key name</td>
<td>Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>Step 3 pool (name)</td>
<td>Configure a local pool address.</td>
</tr>
</tbody>
</table>
Task 7: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Task 8: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name.</td>
</tr>
<tr>
<td>2</td>
<td>keyring keyring-name</td>
<td>Associate a keyring with an ISAKMP profile.</td>
</tr>
<tr>
<td>3</td>
<td>match identity address address [mask] [fvrf]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

Task 9: Configure ISAKMP Profile for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Note: You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.

Task 10: Configure Dynamic VRF Association for VPN Clients

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name. See vrf for information on using this command.</td>
</tr>
<tr>
<td>2</td>
<td>match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

Task 11: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration</td>
</tr>
</tbody>
</table>
### Task 12: Configure the Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto ipsec transform-set transform-set-name</code> <code>transform1 [transform2] [transform3] [transform4]</code></td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

### Task 13: Configure GRE Tunnel Encryption Profile

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto ipsec profile</code></td>
<td>Configure IPSec profile.</td>
</tr>
<tr>
<td><code>set transform-set transform-set-name</code></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

### Task 14: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set isakmp-profile profile-name</code></td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>

### Task 15: Configure Dynamic Crypto Map and Apply Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto dynamic-map dynamic-map-name dynamic-seq-num</code></td>
<td>Create a dynamic crypto map entry and enter the crypto map configuration command mode.</td>
</tr>
<tr>
<td><code>set transform-set transform-set-name</code></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

### Task 16: Configure ISAKMP Client Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set isakmp-profile profile-name</code></td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>
### Chapter 5: IPSec to GRE Service Models

#### Configuring IPSec to GRE+IPSec Service Model

### Task 17: Configure Client RRI

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reverse-route [remote-peer]</code></td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>

### Task 18: Configure Static Crypto Map for Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>crypto map map-name seq-num [ipsec-isakmp]</code></td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td><strong>Step 2</strong> `set peer {hostname</td>
<td>ip-address}`</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>set transform-set transform-set-name</code></td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

### Task 19: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>set isakmp-profile profile-name</code></td>
<td>Set the ISAKMP profile name reference.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>match identity address address [mask] [fvrf]</code></td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

### Task 20: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>crypto map map-name seq-num [ipsec-isakmp]</code></td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>

### Task 21: Configure GRE Tunnel to Customer Site

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>interface type</code></td>
<td>Configure an interface type and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>ip vrf forwarding vrf-name</code></td>
<td>Associate a VRF instance with an interface or subinterface.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip address ip-address mask</code></td>
<td>Set an IP address for an interface.</td>
</tr>
</tbody>
</table>
Configuring IPSec to GRE+IPSec Service Model

Chapter 5  IPSec to GRE Service Models

Task 22: Configure IPSec Profile to be Used

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tunnel protection ipsec-profile name</td>
<td>Associate a tunnel interface with an IPSec profile.</td>
</tr>
</tbody>
</table>

Task 23: Configure Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface type</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip address ip-address mask</td>
</tr>
<tr>
<td>Step 3</td>
<td>encapsulation dot1q vlan-id [native]</td>
</tr>
<tr>
<td>Step 4</td>
<td>crypto map map-name</td>
</tr>
</tbody>
</table>

Note: Each interface services one VPN as the IPSec tunnel endpoint for both the sites and clients.

Task 24: Configure Interface Towards IP Backbone

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>interface type</td>
</tr>
<tr>
<td>Step 2</td>
<td>encapsulation dot1q vlan-id [native]</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip address ip-address mask</td>
</tr>
</tbody>
</table>

Task 25: Configure IGP Used in the Core

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>router ospf process-id</td>
</tr>
<tr>
<td>Step 2</td>
<td>log-adjacency-changes</td>
</tr>
<tr>
<td>Step 3</td>
<td>network ip-address wildcard-mask area area-id</td>
</tr>
</tbody>
</table>
### Task 26: Configure Pool Used to Distribute IP Addresses to VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ip local pool {default</td>
<td>pool-name low-ip-address [high-ip-address]}`</td>
</tr>
</tbody>
</table>

### Task 27: Configure Global Default Route

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ip route network-number network-mask {ip-address</td>
<td>interface-name} [distance] [name name]`</td>
</tr>
</tbody>
</table>

### Task 28: Configure Static VPN Routes if not using IGP within the VPN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip route vrf vrf-name prefix mask [next-hop-address] [interface {interface-number}] [global] [distance] [permanent] [tag tag]</code></td>
<td>Establish static routes for a VPN routing and forwarding (VRF) instance.</td>
</tr>
</tbody>
</table>

### Task 29: Configure the Crypto Access List to Define Traffic to be Encrypted

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} source [source-wildcard] [log]`</td>
</tr>
</tbody>
</table>
**IPSec to GRE+IPSec Configuration Sample**

Figure 5-2 illustrates the following IPSec to GRE+IPSec configuration.

**Figure 5-2  IPSec to GRE Configuration**

```
pe1#sh run
Building configuration...

Current configuration : 4009 bytes
!
version 12.2
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname pe1
enable password cisco
!
username cisco password 0 cisco
!
username cisco password 0 cisco
aaa new-model
```

---

**Step 1**  Configure authentication and authorization lists for clients to RADIUS.

```
aaa authentication login localist local
aaa authorization network localist local
aaa session-id common
ip subnet-zero
no ip domain lookup
```

**Step 2**  Configure the VRFs.

```
ip vrf vpn1
rd 100:1
```

**Step 3**  Configure keyring.

```
crypto keyring vpn1
    pre-shared-key address 20.1.1.1 key cisco123
    pre-shared-key address 40.1.1.2 key cisco123
```
Step 4 Configure the ISAKMP policy for phase 1 negotiations.
```
crypto isakmp policy 1
  authentication pre-share
  group 2
!
crypto isakmp policy 2
  encr 3des
  authentication pre-share
```

Step 5 Configure DPD keepalives.
```
crypto isakmp keepalive 30
crypto isakmp xauth timeout 30
```

Step 6 Configure client group for local authorization.
```
crypto isakmp client configuration group ezvpn
  key cisco123
  pool hw-pool
```

Step 7 Configure ISAKMP profile for VPN sites.
```
crypto isakmp profile vpn1
```

Step 8 Configure dynamic VRF association for sites.
```
vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255
  match identity address 40.1.1.2 255.255.255.255
```

Step 9 Configure ISAKMP profile for VPN clients.
```
crypto isakmp profile vpn1-ez
```

Step 10 Configure dynamic VRF association for VPN clients.
```
vrf vpn1
  match identity group ezvpn
```

Step 11 Configure XAUTH, group authorization, and mode-config.
```
client authentication list localist
isakmp authorization list localist
client configuration address respond
```

Step 12 Configure transform set.
```
crypto ipsec transform-set tset1 esp-3des esp-sha-hmac
```

Step 13 Configure GRE tunnel encryption profile.
```
crypto ipsec profile pe_to_hq
  set transform-set tset1
```

Step 14 Configure ISAKMP site profile reference.
```
set isakmp-profile vpn1
```

Step 15 Configure dynamic crypto map and apply transform set.
```
crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1
```

Step 16 Configure ISAKMP client profile reference.
```
set isakmp-profile vpn1-ez
```
Step 17  Configure client RRI.
reverse-route

Step 18  Configure static map for a site.
crypto map vpn 10 ipsec-isakmp
set peer 20.1.1.1
set transform-set tset1

Step 19  Configure ISAKMP site profile reference.
set isakmp-profile vpn1
match address 101

Step 20  Configure dynamic crypto map for clients.
crypto map vpn 1000 ipsec-isakmp dynamic dyna

Step 21  Configure encrypted GRE tunnel to customer site.
interface Tunnel1
  ip vrf forwarding vpn1
  ip address 11.1.1.1 255.255.255.0
  tunnel source 125.1.10.2
  tunnel destination 40.1.1.2

Step 22  Configure IPSec profile to be used.
tunnel protection ipsec profile pe_to_hq
! interface FastEthernet2/0
  no ip address
  duplex auto
  speed auto

Step 23  Configure internet-facing interface and corresponding crypto maps.
interface FastEthernet2/0.1
  encapsulation dot1Q 10
  ip address 30.1.1.2 255.255.255.0
  crypto map vpn
! interface FastEthernet2/1
  no ip address
  duplex auto
  speed auto

Step 24  Configure interface towards IP backbone.
interface FastEthernet2/1.1
  encapsulation dot1Q 10
  ip address 125.1.10.2 255.255.255.0

Step 25  Configure IGP used in the core.
router ospf 1
  log-adjacency-changes
  network 99.1.1.1 0.0.0.0 area 0
  network 125.1.10.0 0.0.0.255 area 0

Step 26  Configure the pool to distribute IP addresses to VPN clients.
ip local pool hw-pool 192.168.1.1 192.168.1.254
ip classless
Configuring PE to PE Encryption Service Model

In this configuration, a network of GRE tunnels is configured between all the PE devices. Only a single GRE tunnel is necessary between two PEs to service all the VPNs. This is because the VPN tag is maintained across the MPLS network.

Before You Begin

The procedures provided here are specific to configuring PE to PE Encryption and are based on the following assumptions:

- That the following setup and configuration tasks have already been completed:
  - Setup of the core MPLS network.
  - Setup of the customer VPN
  - Configuration of the links between the PE and the CE.
  - Customer-specific information is complete.
- That you have a good understanding of the architecture and features you are using and that you have selected the means you will use to implement those features (for example, which of several strategies you will use for address management or for user authentication and authorization).

PE to PE Encryption Configuration Checklist

This section deals with configuring the router to function as both the IPSec aggregator and the PE router. Procedures for completing each task are described in the sections that follow. If you are viewing this document online, you can click on highlighted text to get details on the procedure.

Table 5-3 PE to PE Encryption Configuration Checklist

| Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS, page 5-25 |
| Task 2: Configure the VRFs, page 5-25 |
| Task 3: Enable CEF Switching, page 5-25 |
| Task 4: Configure the Keyring, page 5-25 |
| Task 5: Configure ISAKMP Policy for Phase 1 Negotiations, page 5-25 |
Chapter 5 IPSec to GRE Service Models

Configuring PE to PE Encryption Service Model

Configuring PE to PE Encryption

Typical PE to PE encryption configuration tasks are shown below. See PE to PE Encryption Configuration Sample, page 5-32.
Task 1: Configure Authentication and Authorization Lists for Clients to RADIUS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: aaa authentication login</td>
<td>Set authentication, authorization, and accounting (AAA) authentication at login.</td>
</tr>
<tr>
<td>Step 2: aaa authorization</td>
<td>Set parameters that restrict user access to a network.</td>
</tr>
<tr>
<td>Step 3: aaa session-id [common</td>
<td>unique]</td>
</tr>
</tbody>
</table>

Task 2: Configure the VRFs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: ip vrf</td>
<td>Configure a VRF routing table.</td>
</tr>
<tr>
<td>Step 2: rd route-distinguisher</td>
<td>Create routing and forwarding tables for a VRF.</td>
</tr>
</tbody>
</table>

Task 3: Enable CEF Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip cef</td>
<td>Enable CEF switching.</td>
</tr>
</tbody>
</table>

Task 4: Configure the Keyring

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: crypto keyring keyring-name [vrf fvrf]</td>
<td>Configure a new keyring for the shared secret keys to be used during IKE authentication.</td>
</tr>
<tr>
<td>Step 2: pre-shared-key [address address [mask]</td>
<td>Configure the addressed preshared key to be used during IKE authentication.</td>
</tr>
<tr>
<td>hostname] key key</td>
<td></td>
</tr>
</tbody>
</table>

Task 5: Configure ISAKMP Policy for Phase 1 Negotiations

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: crypto isakmp policy priority</td>
<td>Configure an IKE policy.</td>
</tr>
<tr>
<td>Step 2: encryption {des</td>
<td>3des</td>
</tr>
<tr>
<td>Step 3: authentication {rsa-sig</td>
<td>rsa-encr</td>
</tr>
</tbody>
</table>
Task 6: Configure DPD Keepalives

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp keepalive secs retries</td>
<td>Allow the gateway to send dead peer detection (DPD) messages to the router.</td>
</tr>
</tbody>
</table>

Task 7: Configure Client Group Definition for Local Authorization

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>crypto isakmp client configuration group</td>
<td>Specify which group's policy profile will be defined.</td>
</tr>
<tr>
<td></td>
<td>{group-name</td>
<td>default}</td>
</tr>
<tr>
<td>2</td>
<td>key name</td>
<td>Configure the IKE preshared key for group policy attribute definition.</td>
</tr>
<tr>
<td>3</td>
<td>pool (name)</td>
<td>Configure a local pool address.</td>
</tr>
</tbody>
</table>

Task 8: Configure ISAKMP Profile for VPN Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Task 9: Configure Dynamic VRF Association for VPN Sites

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name.</td>
</tr>
<tr>
<td>2</td>
<td>keyring keyring-name</td>
<td>Associate a keyring with an ISAKMP profile.</td>
</tr>
<tr>
<td>3</td>
<td>match identity address address [mask] [fvr]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular ISAKMP profile.</td>
</tr>
</tbody>
</table>

Task 10: Configure ISAKMP Profile for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Note: You can configure the Remote sites to match each peer using sequence numbers in the crypto map definition. You can match the peer on IP address or the hostname. The IP address match list for traffic to be encrypted is also defined for each peer. In case of VPN clients, the dynamic profile defined earlier is used to match the clients.
Task 11: Configure Dynamic VRF Association for VPN Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf name</td>
<td>Associate the on-demand address pool with a VRF name. See vrf for information on using this command.</td>
</tr>
<tr>
<td>match identity group-name</td>
<td>Match an acceptable Phase 1 identity from a peer to a Unity group.</td>
</tr>
</tbody>
</table>

Task 12: Configure XAUTH, Group Authorization, and Mode-Config

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>client authentication list list-name</td>
<td>Configure IKE extended authentication (Xauth) on your router. The list-name must match the list-name defined during AAA configuration</td>
</tr>
<tr>
<td>isakmp authorization list list-name</td>
<td>Configure group authorization IKE querying of AAA for tunnel attributes in aggressive mode.</td>
</tr>
<tr>
<td>client configuration address [initiate</td>
<td>initiate</td>
</tr>
</tbody>
</table>

Task 13: Configure ISAKMP Profile for PE to PE Tunnel

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto isakmp profile profile-name</td>
<td>Define an ISAKMP profile for a VPN.</td>
</tr>
</tbody>
</table>

Task 14: Configure the Transform Set

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto ipsec transform-set transform-set-name transform1 [transform2] [transform3] [transform4]</td>
<td>Define the transform set.</td>
</tr>
</tbody>
</table>

Task 15: Configure PE to PE GRE Tunnel Encryption Profile

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto ipsec profile</td>
<td>Configure IPSec profile.</td>
</tr>
<tr>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>
Task 16: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name for client.</td>
</tr>
</tbody>
</table>

Task 17: Configure Client RRI

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>reverse-route [remote-peer]</td>
<td>Create source proxy information for a crypto map entry through RRI.</td>
</tr>
</tbody>
</table>

Task 18: Configure Static Crypto Map for Sites

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [ipsec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
<tr>
<td>set peer {hostname</td>
<td>ip-address}</td>
</tr>
<tr>
<td>set transform-set transform-set-name</td>
<td>Specify which transform sets can be used with the crypto map entry.</td>
</tr>
</tbody>
</table>

Task 19: Configure ISAKMP Site Profile Reference

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>set isakmp-profile profile-name</td>
<td>Set the ISAKMP profile name reference.</td>
</tr>
<tr>
<td>match identity address address [mask] [fvrf]</td>
<td>Match an acceptable Phase 1 identity from a peer to a particular isakmp profile.</td>
</tr>
</tbody>
</table>

Task 20: Configure Dynamic Crypto Map for Clients

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>crypto map map-name seq-num [ipsec-isakmp]</td>
<td>Create a crypto map entry that uses IKE to establish the IPSec SAs for protecting the traffic specified by this crypto map entry.</td>
</tr>
</tbody>
</table>
Chapter 5  IPSec to GRE Service Models

Task 21: Configure PE to PE GRE Tunnel

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> interface type</td>
<td>Configure an interface type and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ip address ip-address mask</td>
<td>Set an IP address for an interface.</td>
</tr>
</tbody>
</table>

Task 22: Turn on Tag-Switching

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> tag-switching ip</td>
<td>Configure label switching of IPv4 packets on an interface.</td>
</tr>
<tr>
<td><strong>Step 2</strong> tunnel source {ip-address</td>
<td>type number}</td>
</tr>
<tr>
<td><strong>Step 3</strong> tunnel destination {hostname</td>
<td>ip-address}</td>
</tr>
</tbody>
</table>

Task 23: Configure IPSec Profile to be Used

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tunnel protection ipsec-profile name</td>
<td>Associate a tunnel interface with an IPSec profile.</td>
</tr>
</tbody>
</table>

Task 24: Configure Internet-Facing Interface and Corresponding Crypto Maps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

  pool hw-pool
```

Step 8 Configure ISAKMP profile for VPN sites.
```plaintext
crypto isakmp profile vpn1
```

Step 9 Configure dynamic VRF association for sites.
```plaintext
vrf vpn1
  keyring vpn1
  match identity address 20.1.1.1 255.255.255.255
  match identity address 40.1.1.2 255.255.255.255
```

Step 10 Configure ISAKMP profile for VPN clients.
```plaintext
crypto isakmp profile vpn1-ez
```

Step 11 Configure dynamic VRF association.
```plaintext
vrf vpn1
  match identity group ezvpn
```

Step 12 Configure XAUTH, group authorization, and mode-config.
```plaintext
client authentication list localist
isakmp authorization list localist
client configuration address respond
```

Step 13 Configure ISAKMP profile for PE-PE tunnel.
```plaintext
crypto isakmp profile gre
  keyring gre
  match identity address 125.1.20.2 255.255.255.255
```

Step 14 Configure the transform set.
```plaintext
crypto ipsec transform-set tset1 esp-3des esp-sha-hmac

crypto ipsec transform-set tset2 esp-3des esp-sha-hmac
  mode transport
```
Step 15  Configure IPSec profile for PE-PE GRE tunnel.

crypto ipsec profile gre1
  set transform-set tset2
  set isakmp-profile gre
!
crypto dynamic-map dyna 1
  set security-association idle-time 3600
  set transform-set tset1

Step 16  Configure ISAKMP client profile reference.

  set isakmp-profile vpn1-ez

Step 17  Configure client RRI.

  reverse-route

Step 18  Configure static map for a site.

crypto map vpn 10 ipsec-isakmp
  set peer 20.1.1.1
  set transform-set tset1

Step 19  Configure ISAKMP site profile reference.

  set isakmp-profile vpn1
  match address 101

Step 20  Configure dynamic crypto map for clients.

crypto map vpn 1000 ipsec-isakmp dynamic dyna
  interface Loopback0
  ip address 99.1.1.1 255.255.255.255

Step 21  Configure PE-PE GRE tunnel.

  interface Tunnel1
  ip address 11.1.1.1 255.255.255.252

Step 22  Turn on tag-switching.

tag-switching ip
tunnel source FastEthernet2/1.1
tunnel destination 125.1.20.2

Step 23  Configure IPSec profile reference.

  tunnel protection ipsec profile gre1
  interface FastEthernet2/0
  no ip address
duplex auto
speed auto

Step 24  Configure Internet-facing interface and corresponding crypto maps.

  interface FastEthernet2/0.1
  encapsulation dot1Q 10
  ip address 30.1.1.2 255.255.255.0
  crypto map vpn
  !
  interface FastEthernet2/1
  no ip address
duplex auto
speed auto
Step 25  Configure interface towards IP backbone.
  
  interface FastEthernet2/1.1
  encapsulation dot1Q 10
  ip address 125.1.10.2 255.255.255.0
  tag-switching ip

Step 26  Configure IGP used in the core.
  
  router ospf 1
  log-adjacency-changes
  network 99.1.1.1 0.0.0.0 area 0
  network 125.1.10.0 0.0.0.255 area 0
  !
  router bgp 100
  no synchronization
  bgp log-neighbor-changes
  timers bgp 10 30
  neighbor 11.1.1.2 remote-as 100
  no auto-summary

Step 27  Configure PE peering for VPN routes.
  
  address-family vpnv4
  neighbor 11.1.1.2 activate
  neighbor 11.1.1.2 send-community both
  no auto-summary
  exit-address-family
  !
  address-family ipv4 vrf vpn1
  redistribute static
  no auto-summary
  no synchronization
  exit-address-family

Step 28  Configure the pool to distribute IP addresses to VPN clients.
  
  ip local pool hw-pool 192.168.1.1 192.168.1.254
  ip classless

Step 29  Configure the global default route.
  
  ip route 0.0.0.0 0.0.0.0 FastEthernet2/0.1 30.1.1.1

Step 30  Configure static VPN routes if not using IGP within the VPN.
  
  ip route vrf vpn1 101.1.1.0 255.255.255.0 30.1.1.1 global

Step 31  Configure the crypto access list.
  
  access-list 101 permit ip 101.1.2.0 0.0.0.255 101.1.1.0 0.0.0.255
Configuring AAA Servers for Remote Clients

AAA Servers Overview

The AAA servers are RADIUS servers that are service provider-managed or customer-managed. The RADIUS servers may be Cisco ACS or Cisco Access Registrar or a customer’s RADIUS server.

RADIUS provides user authentication (XAUTH) and authorization in the Unity protocol to the client and to the IPSec aggregator to enable a successfully authenticated client to use the service authorized. Using the RADIUS server also limits the amount of pre-provisioning and re-provisioning that is necessary on each client and on each IPSEC Aggregator.

For information on configuring RADIUS, see: http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fsecur_c/fsecsp/scfrad.htm

Managed AAA Configuration

In a managed AAA configuration, you (the service provider) administer a RADIUS system for customer-specific user information. The customer must provide you with the names of one or more administrators who are responsible for user administration, as well as their initial user-id/passwords. After you configure the administrators, the customer can add, delete, modify, and view users without your (service provider) intervention.

Proxy AAA Configuration

In a proxy AAA configuration, the service provider performs authorization while the customer controls user authentication. Proxy AAA is the only configuration that supports two-factor authentication (token card). When a customer manages an AAA system, one or more IP addresses must be associated with the customer AAA system. In addition to IP addresses, it is necessary to configure a shared secret on both ends of the proxy (service provider and customer). The shared secret should be a well-formed password and it must be communicated.

Chapter 6  Configuring AAA Servers for Remote Clients

Per-VRF AAA

Using the Per VRF AAA feature, Internet Service Providers (ISPs) can partition authentication, authorization, and accounting (AAA) services based on Virtual Route Forwarding (VRF). This feature permits the IPSec aggregator to communicate directly with the customer's RADIUS server, which is associated with the customer's Virtual Private Network (VPN), without having to go through a RADIUS proxy. Thus, ISPs can scale their VPN offerings more efficiently because they no longer need to proxy AAA to provide their customers with the flexibility they demand.

For information on configuring per-VRF AAA, see http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvrfaaa.htm#1015329.

IPSec VPN Accounting

The IPSec VPN Accounting feature allows for a session to be accounted for by indicating the times that the session starts and stops. Additionally, session-identifying information and session-usage information are passed to the Remote Authentication Dial-In User Service (RADIUS) server using RADIUS attributes and vendor-specific attributes (VSAs).

For information on configuring IPSec VPN accounting, see http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_evpna.htm.

Preprovisioning to Support Unity Client

This section deals with pre-provisioning on the IPSEC Aggregator and AAA server for Unity client support as well as the provisioning needed on the client.

Note

Unlike the site-to-site model, much of the information configured at the head-end is VPN-specific, not tunnel endpoint-specific.

To support Unity clients, you must obtain information on IP address pools, DNS, WINS, and other policy when signing up customers for VPN service for remote access clients. You can store this information locally on the IPSec Aggregator or in your AAA server. You can store user-specific information (for example, username and passwords) as well as any user-specific policy information (for example, session time-outs) in your AAA server; however, for scaling reasons it may make more sense to store this information in the customer's AAA server.

Note

In the absence of per-group AAA support, the service provider AAA server may proxy a request to the customer AAA server.

AAA Server Preprovisioning

An ISAKMP client configuration group (or VPN group) is a group of Unity clients that share the same authentication and configuration information. The shared group information consists of the following:

- Password (if preshared keys are used)
• IP address or name of IP address pool on IPSec aggregator from which an IP address is to be assigned to client
• IP addresses of primary and secondary DNS servers
• IP addresses of primary and secondary WINS servers
• Default domain name
• Name of access control list (ACL) to be applied at client when enabling split tunneling

**IPSec Aggregator Preprovisioning**

On the IPSec Aggregator, you need to pre-provision the following (assuming aggressive mode and pre-shared keys):

• How to reach SP-managed AAA server (global or management VPN) and customer-managed AAA servers (per customer VPN), if any.
• Indicate whether VPN group information is local or stored in a AAA server.
• If local, the above client group information is configured on the IPSEC aggregator.
• If remote, the name of the SP-managed AAA server to be used to fetch group configuration.
• Define the (overlapping) address pools referred to in the VPN group information, if any. Address range is provided by customer and assigned by SP.
• Define the ACLs referred to in the VPN group information which are used to enforce split tunneling at the Unity client is enabled.
• Define ISAKMP profile per VPN including:
  – Matching client configuration group.
  – VRF ID.
  – If XAUTH used, the name of the SP-managed or customer-managed AAA server to be used for user authentication.
• Define IPSec tunnel mode crypto policies per VPN.
• Define dynamic crypto map per VPN (same crypto map name, different policies) including ISAKMP profile, IPSEC policy.
• Crypto map applied to Internet-facing interfaces.

**Cisco Unity Client Preprovisioning**

We assume client has been assigned a global IP address from local ISP and sufficient configuration for Internet Access. We assume Unity client is pre-provisioned with:

• Public IP address or hostname of IPSEC aggregator
• Pre-shared group key with IPSEC aggregator
• XAUTH (username password or token)
• IKE authentication and encryption policy
• IPSEC authentication and encryption policy
Cisco Unity Client Operation

The Unity protocol operates based on the notion of a client group. A Unity client must identify and authenticate itself by group first, and if XAUTH enabled, by user later.

The Unity protocol supports either:

- Aggressive mode and pre-shared keys
- Main mode and certificates

In terms of AAA support, you can use RADIUS servers to store client group configuration information (including the pre-shared group password in case of aggressive mode and mode-config information) as well as to authenticate users (XAUTH). RADIUS servers can only be defined globally.

Assuming use of aggressive mode and pre-shared keys, as well as use of RADIUS servers for storing client group configuration information and for user authentication, the Unity protocol operates as follows:

1. If the IKE SA negotiates use of XAUTH, the client waits for a challenge and responds.
2. The server authenticates the user, typically using the customer's AAA server via a service provider AAA proxy. Any user-specific configuration information may be downloaded at this time or downloaded separately later.
3. The client requests mode-config parameters from the server. These include IP address, IP addresses of DNS and WINS servers, default domain name and ACLs to be applied if split tunneling is enabled.
4. If configured to do so, the server fetches the mode-config parameters from the your (service provider) AAA server based on group name. The server may also need to fetch user-specific information based on user name (for example, static IP address).
5. If configured to do so, the IPsec Aggregator allocates an IP address from the pre-defined IP address pool and sets up a route to the client in the appropriate routing table (global or VRF). The server returns the above information to the client.

For more information, see the Sequence of Operations for Remote Access, see Chapter 2, “Configuring the IPSec to MPLS Service Model” in the Cisco Network-Based IPSec VPN Solution Release 1.5 Implementation Guide.

User Authentication

The Unity protocol operates based on the notion of a client group. A Unity client must identify and authenticate itself by group first, and if XAUTH enabled, by user later.

VPN clients should be authenticated by XAUTH to deny unauthorized access.

VPN group information consists of the following:

- Password if pre-shared keys are used
- Interface that VPN group allowed to come in on (from 12.2(9.4)T only)
Chapter 6      Configuring AAA Servers for Remote Clients

AAA Authorization

AAA authorization enables you to limit the services available to a user. When AAA authorization is enabled, the network access server uses information retrieved from the user's profile, which is located either in the local user database or on the service provider AAA server, to configure the user's session. When this is done, the user is granted access to a requested service only if the information in the user profile allows it. See:

The following IPSEC-related configuration information is available upon authorization:

- Pre-shared key per Unity group or per IPSec peer
- Unity group configuration per VPN (mode-config)
- IP address
- IP address pool
- ACL for split tunneling
- ISAKMP profile
- Virtual interface profiles for virtual IPSEC interfaces (if any)

IPSec Accounting

If IPSec accounting is configured for the session an accounting start record is generated after the IKE phases are complete.

New accounting records are not generated during a re-key.

The accounting start record contains the following information:

- Group name
- User name
- Assigned IP address
- Interface for the connection
- Accounting list
- VRF ID
- AAA unique id
- ISAKMP Phase 1 ID information
- Status
- ACCT_REQUIRED
- START_REQUEST
- STARTED
- STOPPED
- NOT_REQUIRED

Below is an account start record generated on the router that goes to the defined AAA server.

*Aug 23 04:06:20.131: RADIUS(00000002): sending
*Aug 23 04:06:20.131: RADIUS(00000002): Send Accounting-Request to 100.1.1.4:1646 id 4, len 220
*Aug 23 04:06:20.131: RADIUS: authenticator 38 F5 EB 4D BE 4A 6F - 45 EB EF 7D B7 19 FB 3F
*Aug 23 04:06:20.139: RADIUS: Received from id 21645/4 100.1.1.4:1646, Accounting-response, len 20
*Aug 23 04:06:20.139: RADIUS: authenticator B7 E3 D0 F5 61 9A 89 D8 - 99 A6 8A 8A 98 79 9D 5D

**Accounting Stop**

An accounting stop packet is generated when there are no flows (IPSec SA pairs) being protected to an IPSec Peer.

Accounting stop records contain the following information

- Packets out
- Packets in
- Octets out
- Octets in
- Gigawords in
- Gigawords out

Below is an account start record generated on the router that is sent to the defined AAA server.

*Aug 23 04:20:16.519: RADIUS(00000003): Using existing nas_port 0
Chapter 6 Configuring AAA Servers for Remote Clients

Cisco Unity Client Operation

Accounting Updates

You can enable periodic interim accounting records to be sent to the accounting server(s) using the `aaa accounting update` command. For more information on this command, see http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122tcr/122tsr/faaacr/sftacct.htm#1041103.

Below is a sample accounting update record:

```
7200-UUT#
*Aug 23 21:46:05.263: RADIUS(00000004): Using existing nas_port 0
*Aug 23 21:46:05.263: RADIUS(00000004): Config NAS IP: 100.1.1.147
*Aug 23 21:46:05.263: RADIUS(00000004): sending
*Aug 23 21:46:05.263: RADIUS(00000004): Send Accounting-Request to 100.1.1.4:1646 id 22, len 200
*Aug 23 21:46:05.263: RADIUS: authenticator 30 FA 86 8E 43 8E 4B - F9 09 71 04 4A F1 52 25
*Aug 23 21:46:05.263: RADIUS: Received from id 21645/19 100.1.1.4:1646,
Accounting-response, len 20
*Aug 23 21:46:05.263: RADIUS: authenticate F1 CA C1 28 CE A0 26 C9 - 3E 22 C9 DA EA B8 22 A0
```
Using RADIUS for Network-Based IPSec

The Cisco network-based IPSec VPN solution release 1.5 supports RADIUS-based authentication and authorization for remote access clients.

During authorization of a remote access client, the following attributes can be downloaded from RADIUS:

```
cisco-avpair = "ipsec:key-exchange=ike"
cisco-avpair = "ipsec:tunnel-password=cisco123"
cisco-avpair = "ipsec:addr-pool=mypool"
cisco-avpair = "ipsec:default-domain=cisco.com"
cisco-avpair = "ipsec:dnsservers=1.1.1.9"
cisco-avpair = "ipsec:wins-servers=3.3.3.9"
cisco-avpair = "ipsec:access-restrict=ATM5/0.101"
```
RADIUS Configuration Sample

The following is a sample user and group configuration for remote VPN clients from Cisco Access Registrar.

User configuration (no attributes):

```plaintext
[ //localhost/RADIUS/UserLists/Default/joe-coke ]
Name = joe-coke
Description =
Password = <encrypted>
AllowNullPassword = FALSE
Enabled = TRUE
Group~ =
BaseProfile~ =
AuthenticationScript~ =
AuthorizationScript~ =
UserDefined1 =
```

```plaintext
[ //localhost/RADIUS/UserLists/Default/group1 ]
Name = group1
Description =
Password = <encrypted>  (would be "cisco")
AllowNullPassword = FALSE
Enabled = TRUE
Group~ =
BaseProfile~ = group1profile
AuthenticationScript~ =
AuthorizationScript~ =
UserDefined1 =
```

Define the group attributes such as pre-shared key, IP address pool name, etc. using Cisco AV-pairs:

```plaintext
[ //localhost/RADIUS/Profiles/group1profile/Attributes ]
cisco-avpair = ipsec:key-exchange=ike
cisco-avpair = ipsec:tunnel-password=cisco123
cisco-avpair = ipsec:addr-pool=pool1
Service-Type = Outbound
```
Server Load Balancing for VPN Clients

The Cisco IOS server load balancing (SLB) feature is an IOS-based solution that provides IP server load balancing. Using the IOS SLB feature, you can define a virtual server that represents a group of real servers in a cluster of network servers known as a server farm. In this environment, the clients connect to the IP address of the virtual server. When a client initiates a connection to the virtual server, the IOS SLB function chooses a real server for the connection based on a configured load-balancing algorithm.

For more information on server load balancing, see http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121e/121e9/iosslb9e.htm#2711438.

In the Cisco network-based IPSec VPN solution release 1.5, server load balancing is necessary to distribute a large number of IPSec tunnels over multiple IOS devices.

A Cisco NPE-400 with V AM can accommodate up to 1500 clients or layer 2 tunnels. The Cisco network-based IPSec VPN solution release 1.5 can be scaled up using multiple Cisco 7200 routers stacked behind a load-balancer.

Below is a sample configuration for server load balancing that uses a Cisco Catalyst 6500 switch with the SLB feature to distribute the client tunnels. It also provides related configurations for two Cisco 7200 routers used in the configuration.

```
ip slb probe IPSEC ping
  << ping will be used to determine availability of 7200 address
  220.1.1.1 << Loopback address on 7200; this address is the crypto endpoint address.
ip slb serverfarm IPSEC
  failaction purge
  !
ip slb serverfarm IPSEC
  failaction purge
  !
real 192.168.1.1
```

This is a reference to probe method defined above.

The real server address.

interface FastEthernet4/2
This is the uplink to the Internet gateway.

```conf
ip address 212.1.1.1 255.255.255.0
duplex full
speed 100

interface FastEthernet4/3
```

This is the connection to the first Cisco 7200 router.

```conf
ip address 192.168.1.2 255.255.255.0
duplex full
speed 100
```

Below is the connection to the second Cisco 7200 router.

```conf
interface FastEthernet4/4 << Connection to 2nd 7200
ip address 192.168.2.2 255.255.255.0
duplex full
speed 100
```

First Server is Cisco 7200 series router.

```conf
hostname EUROPA-7200

! Make sure you define TDP ID.
tag-switching tdp router-id Loopback0 <<
```

Loopback 1 address is used.

```conf
crypto map crypmap local-address Loopback1 <<
interface Loopback0
```

Address is different on both Cisco 7200 routers.

```conf
ip address 101.1.1.9 255.255.255.255
! interface Loopback1
```

Address is the same as virtual address defined on SLB.

```conf
ip address 220.1.1.1 255.255.255.255
!
interface FastEthernet0/0
```

Upgrading to VRF-Aware IPSec

Cisco IOS Release 12.2(15)T introduces the VRF-Aware IPSec feature for IP Security (IPSec) tunnel mapping to Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). You can use this feature to map IPSec tunnels to Virtual Routing and Forwarding (VRF) instances using a single public-facing address.

For more information on VRF-Aware IPSec, see http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_vrfip.htm#wp1027129.

You must make minor configuration changes in order for the VRF-Aware IPSec feature to work in legacy IPSec configurations.

This appendix provides a sample legacy IPSec configuration and an upgraded IPSec configuration with VRF-Aware IPSec. Additionally, this appendix provides an appropriate debug session.

Sample Legacy Configuration

Upgraded Configuration with VRF-Aware IPSec

The upgraded configuration is shown below.

Note
Changes to the sample legacy configuration are noted within the configuration.

Note
You must add a keyring for every remote peer within the VRF. Do not remove the existing crypto isakmp keys.

New Configuration:

GLOSSARY

A

Access VPN  Provides remote access to a corporate intranet or extranet over a shared infrastructure with the same policies as a private network. Access VPNs enable users to access corporate resources whenever, wherever, and however they require. Access VPNs encompass analog, dial, ISDN, Digital Subscriber Line (DSL), mobile IP, and cable technologies to securely connect mobile users, telecommuters, or branch offices.

ACL  Access Control List.

ADSL  Asymmetric Digital Subscriber Line. A type of DSL supporting upstream and downstream speeds that are different.

AH  Authentication Header. A security protocol that provides authentication and optional replay-detection services. AH is embedded in the data to be protected (a full IP datagram, for example). AH can be used either by itself or with Encryption Security Payload (ESP).

ATM  Asynchronous Transfer Mode.

C

CAC  Call Admission Control.

CE  Customer Edge router. This device is typically located at the customer site and connects to the service provider network. Same as CPE.

CIC  Cisco InfoCenter.

CLEC  Competitive Local Exchange Carrier.

CO  Central Office.

COS  Class of Service. Classification of traffic that allows differentiated processing using prioritization and QOS features.

CPE  Customer Premises Equipment. Same as CE, more widely used in IPsec VPNs.

CSRC  Cisco Subscriber Registration Center.
**D**

**DES**

Data Encryption Standard. The DES was published in 1977 by the National Bureau of Standards and is a secret key encryption scheme based on the Lucifer algorithm from IBM. The contrast of DES is public-key. Cisco uses DES in classic crypto (40-bit and 56-bit key lengths), IPsec crypto (56-bit key), and on the PIX Firewall (56-bit key).

---

**E**

**Extranet VPN**

Links customers, suppliers, partners, or communities of interest to a corporate intranet over a shared infrastructure using dedicated connections. Businesses enjoy the same policies as a private network, including security, QoS, manageability, and reliability.

---

**G**

**GRE**

Generic Routing Encapsulation. Tunneling protocol developed by Cisco that can encapsulate a wide variety of protocol packet types inside IP tunnels, creating a virtual point-to-point link to Cisco routers at remote points over an IP internetwork. By connecting multiprotocol subnetworks in a single-protocol backbone environment, IP tunneling using GRE allows network expansion across a single-protocol backbone environment.

---

**I**

**IDS**

Intrusion Detection System.

**IKE**

Internet Key Exchange. A hybrid protocol that uses part Oakley and part of another protocol suite called SKEME inside the Internet Security Association and Key Management Protocol (ISAKMP) framework. IKE is used to establish a shared security policy and authenticated keys for services (such as IPsec) that require keys. Before any IPsec traffic can be passed, each router/firewall/host must be able to verify the identity of its peer. This can be done by manually entering pre-shared keys into both hosts, by a CA service, or the forthcoming secure DNS (DNSSec). This is the protocol formerly known as ISAKMP/Oakley, and is defined in The Internet Key Exchange (IKE). A potential point of confusion is that the acronyms "ISAKMP" and "IKE" are both used in Cisco IOS software to refer to the same thing. These two items are somewhat different, as you will see in the next definition.

**Intranet VPN**

Links corporate headquarters, remote offices, and branch offices over a shared infrastructure using dedicated connections. Businesses enjoy the same policies as a private network, including security, quality of service (QoS), manageability, and reliability.

</tbody>
</table>
SOC  Security Operations Center.

Stateful Firewall  A secure method of analyzing packets that places extensive information about a data packet in a table. In order for a session to be established, information about the connection must match information stored in the table.
