THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: The equipment described in this manual generates and may radiate radio-frequency energy. If it is not installed in accordance with Cisco's installation instructions, it may cause interference with radio and television reception. This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in part 15 of the FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

Modifying the equipment without Cisco's written authorization may result in the equipment no longer complying with FCC requirements for Class A or Class B digital devices. In that event, your right to use the equipment may be limited by FCC regulations, and you may be required to correct any interference to radio or television communications at your own expense.

You can determine whether your equipment is causing interference by turning it off. If the interference stops, it was probably caused by the Cisco equipment or one of its peripheral devices. If the equipment causes interference to radio or television reception, try to correct the interference by using one or more of the following measures:

- Turn the television or radio antenna until the interference stops.
- Move the equipment to one side or the other of the television or radio.
- Move the equipment farther away from the television or radio.
- Plug the equipment into an outlet that is on a different circuit from the television or radio. (That is, make certain the equipment and the television or radio are on circuits controlled by different circuit breakers or fuses.)

Modifications to this product not authorized by Cisco Systems, Inc. could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Access Registrar, AccessPath, Any to Any, AtmDirector, CCDA, CCDE, CCDP, CCIE, CCNA, CCNP, CCSI, CD-PAC, the Cisco logo, Cisco Certified Internetwork Expert logo, *CiscoLink*, the Cisco Management Connection logo, the Cisco NetWorks logo, the Cisco Powered Network logo, Cisco Systems Capital, the Cisco Systems Capital logo, Cisco Systems Networking Academy, the Cisco Technologies logo, ConnectWay, ControlStream, Fast Step, FireRunner, GigaStack, IGX, JumpStart, Kernel Proxy, MGX, Natural Network Viewer, NetSonar, Network Registrar, *Packet*, PIX, Point and Click Internetworking, Policy Builder, Precept, RouteStream, Secure Script, ServiceWay, SlideCast, SMARTnet, StreamView, *The Cell*, TrafficDirector, TransPath, ViewRunner, VirtualStream, VisionWay, VlanDirector, Workgroup Director, and Workgroup Stack are trademarks; Changing the Way We Work, Live, Play, and Learn, Empowering the Internet Generation, The Internet Economy, and The New Internet Economy are service marks; and Assist, BPX, Catalyst, Cisco, Cisco IOS, the Cisco IOS logo, Cisco Systems, the Cisco Systems logo, the Cisco Systems Cisco Press logo, Enterprise/Solver, EtherChannel, EtherSwitch, FastHub, FastLink, FastPAD, FastSwitch, IOS, IP/TV, IPX, LightStream, LightSwitch, MICA, NetRanger, Registrar, StrataView Plus, Stratm, TeleRouter, and VCO are registered trademarks of Cisco Systems, Inc. in the U.S. and certain other countries. **Feedback on the
Cisco WAN
Switching SuperUser
Command Reference
78-6722-05 Rev. A0**

**Release 9.2
November, 2002**

Thank you for taking the time to fill out this response card. Your input is important to us and helps us to provide you with better documentation.

If you have comments about this document, please complete this self-addressed response card and mail it to us.

We also encourage you to make copies of this blank response card to complete and send to us whenever you have comments about this document. You can mail copies of this card to:

Cisco Systems, Inc.
Attn: Document
Resource Connection
170 West Tasman Drive
San Jose, CA 95134-9883

You can also send us your comments by e-mail to bug-doc@cisco.com, or fax your comments to us at (408) 527-8089.

You can also submit comments electronically on the World Wide Web. Click **Feedback** in the toolbar and select **Documentation**. After you complete the form, click **Submit** to send it to Cisco. We appreciate your comments.

Documentation Response Card

Feedback on the Cisco WAN Switching SuperUser Command Reference, Release 9.2, July 2002, Part Number 78-6722-05 Rev. A0

Please respond to the following statements by checking a number from 1 to 5:

- 5 Strongly agree
- 4 Somewhat agree
- 3 Neutral
- 2 Somewhat disagree
- 1 Strongly disagree

Overall, I am satisfied with this document.

Strongly agree 5 4 3 2 1 Strongly disagree

This document is accurate and free of errors.

Strongly agree 5 4 3 2 1 Strongly disagree

I can find the information I need in this document.

Strongly agree 5 4 3 2 1 Strongly disagree

This document is complete and offers enough relevant information for me to do my job.

Strongly agree 5 4 3 2 1 Strongly disagree

This document is written at the correct level of complexity for the subject matter.

Strongly agree 5 4 3 2 1 Strongly disagree

This document is useful to me in doing my job.

Strongly agree 5 4 3 2 1 Strongly disagree

Would you like us to contact you? Yes No

SuperUser Commands	1-1
Introduction	1-1
General Information	1-1
Descriptions for Statistics CLI Commands	1-2
Statistics Command Descriptions	1-2
Functional Description of Channel Statistics	1-2
burnfwrev (Burn Firmware Image into Card(s))	1-6
clrcderr (Clear Detailed Card Errors)	1-8
clrcnf (Clear Configuration Memory)	1-10
clrfpevt (Clear FastPAD Event Reporting)	1-11
cnfabrparm (Configure Assigned Bit Rate Queue Parameters)	1-13
cnfbusbw (Configure UXM Card Bus Bandwidth)	1-15
cnfcdparm	1-17
Description of Summary and Interval Statistics	1-17
Multilevel Channel Statistics Support	1-18
UXM/BXM multilevel Channel Statistics Feature	1-19
Cisco WAN Manager	1-20
Channel Statistics Collection and Display	1-20
Memory Requirements	1-20
BPX Platform	1-20
IGX Platform	1-20
Multilevel Statistics Supported on UXM Card	1-26
Setting the Statistics Level on the UXM Card	1-26
Levels of Support on UXM Card for Various Statistics	1-27
Compatibility with 9.1 Classic Statistics	1-29
Descriptions for Statistics Fields on cnfcdparm Screen	1-34
cnfcdpparm (Configure CVM Card Parameters)	1-41
cnfcftst (Configure Communication Fail Test Pattern)	1-43
cnfchstats (Configure Channel Statistics Collection)	1-44
cnfchsts (Configure Channel Timestamp)	1-48
cnfclnparm (Configure Circuit Line Parameter)	1-50
cnfclnsigparm (Configure Circuit Line Signaling Parameters)	1-51
cnfcmparm (Configure Connection Management Parameters)	1-54

cnfdiagparm (Configure Diagnostic Test Parameters) 1-59
 cnfdlparm (Configure Download Parameters) 1-61
 cnfecparm (Configure Echo Canceller Parameters) 1-65
 cnffpcom (Configure FastPAD Communication Parameters) 1-67
 cnffpcon (Configure FastPAD Connection Parameters) 1-68
 cnffpddelay (Configure FastPAD Delay) 1-69
 cnffpdpvc (Configure FastPAD PVC) 1-70
 cnffpmap (Configure FastPAD Map Table) 1-71
 cnffpport (Configure FastPAD Port) 1-72
 cnffpsys (Configure FastPAD System Parameters) 1-73
 cnffstparm (Configure ForeSight Node Parameters) 1-74
 cnflan (Configure LAN) 1-76
 cnflnparm (Configure ATM Line Card Parameters) 1-78
 cnflnsigparm (Configure Line Signaling Parameters) 1-79
 cnflnstats (Configure Line Statistics Collection) 1-82
 cnfclnstats (Configure Circuit Line Statistics) 1-90
 cnfmxbutil (Configure Muxbus Utilization) 1-93
 cnfnodeparm (Configure Node Parameter) 1-95
 cnfnwip (Configure Network IP Address) 1-115
 cnfphyslnstats (Configure Physical Line Statistics) 1-117
 cnfportstats (Configure Port Statistics Collection) 1-123
 cnfrobparm (Configure Robust Alarms Parameters) 1-128
 cnfslotstats (Configure Slot Statistics Collection) 1-130
 cnftcpparm (Configure TCP Parameters) 1-132
 cnftermfunc (Configure Terminal Port Functions) 1-133
 cnftlparm (Configure Trunk-Based Loading Parameters) 1-136
 cnfttrafficgen 1-138
 Traffic Generation Test 1-138
 cnftrkparm (Configure Trunk Card Parameters) 1-141
 Configuring Virtual Trunks with cnftrkparm Command 1-141
 Configuring Trunk Queues Used by Real-Time VBR and Non-Real-Time VBR
 Connections 1-141
 Physical and Virtual Parameters You Can Configure Using cnftrkparm 1-152
 cnftrkstats (Configure Trunk Statistics Collection) 1-154
 cnfstparm (Configure Card Test Parameters) 1-161
 cnfuiparm (Configure User Interface Parameters) 1-164

cnfvumchparm (Configure Channel Parameters on a UVM)	1-166
cnfvchparm (Configure Voice Channel Parameter)	1-168
cpyfpmmap (Copy FastPAD Map Table)	1-171
dchst (Display Channel Status)	1-172
diagbus (Diagnose Failed Bus)	1-174
drtop (Display Route Op Table)	1-175
dspasich (Display ASI Channel Routing Entry)	1-176
dspbuses (Display Bus Status)	1-177
dspcardstats (Display BXM Card Statistics)	1-179
BXM Card Statistics Descriptions for dspcardstats Command	1-180
dspcderrs (Display Card Errors)	1-186
dspcftst (Display Communication Fail Test Pattern)	1-187
dspchan (Display Channel Configuration)	1-188
dspchstatcnf (Display Statistics Enabled for a Channel)	1-190
dspchstathist (Display Statistics History for a Channel)	1-191
dspchstats (Display All Enabled Statistics for a Channel)	1-193
Descriptions for Statistics Fields on dspchstats	1-195
dspclnstatcnf (Display Circuit Line Statistics Configuration)	1-200
dspclnstathist (Display Statistics History for a Circuit Line)	1-201
dspcnf (Display Configuration Save/Restore Status)	1-203
dspdnl (Display Download)	1-204
dspdutl (Display Data Channel Utilization)	1-206
dspcparm (Display Echo Canceller Parameters)	1-208
dspfpdsc (Display FastPAD Card Descriptor)	1-210
dspfwrev (Display Firmware Revision)	1-211
dsphitless (Display Statistical History of Hitless Rebuilds)	1-213
What Hitless Rebuild Feature Provides in Release 9.2	1-213
Purpose of Hitless Rebuild	1-213
Acronyms	1-214
Software Revisions and Interoperability	1-214
Description of how Hitless Rebuild Works	1-214
Safe Switchover	1-215
Action Taken if the Control Card Fails	1-215
Autobus Diagnostic Feature Disabled	1-217
How Memory is Managed during Hitless Rebuilds	1-217
Errors and Alarm Handling	1-218
Consistency Checking	1-218
Node Reliability and Maintainability	1-219
Hitless Rebuild Examples	1-219

Normal switchcc 1-219
 Abort -- Standby not Ready 1-220
 Commbus failure 1-220
 dsplnstatcnf (Display Statistics Enabled for a Line) 1-223
 dsplnstatthist (Display Statistics Data for a Line) 1-224
 dspphyslnstatcnf (Display Statistics Enabled for a Physical Line) 1-226
 dspphyslnstatthist (Display Statistics Data for a Physical Line) 1-228
 dspportstatcnf (Display Statistics Enabled for a FR Port) 1-230
 dspportstatthist (Display Statistics History for a FR Port) 1-231
 dsprevs (Display Revisions) 1-233
 dsprobst (Display Robust Statistics) 1-235
 dsprrst (Display Reroute Statistics) 1-236
 dspsig (Display Signaling) 1-238
 dspslot (Display Slot) 1-239
 dspslotstatcnf (Display Statistics Enabled for a BXM Card Slot) 1-241
 dspslotstatthist (Display Statistics History for a BXM Card) 1-242
 dspstatfiles (Display TFTP Statistics File Information) 1-243
 dspstatmem (Display Statistics Memory Use) 1-246
 dsptcparm (Display TCP Parameters) 1-247
 dsptrkcons (Display Trunk Connection Counts) 1-248
 dsptrkmcons (Display Trunk Connection Counts by Master Node) 1-249
 dsptrkstatcnf (Display Statistics Enabled for a Trunk) 1-250
 dsptrkstatthist (Display Statistics History for a Trunk) 1-252
 dsputl (Display Utilization) 1-254
 getfwrev (Get Firmware Revision) 1-256
 killuser (Log Out a User) 1-257
 loadcnf (Load Configuration) 1-258
 loadrev (Load Revision) 1-259
 prtderrs (Print Card Errors) 1-260
 rrtcon (Reroute Connection) 1-261
 rststats (Reset Statistics Collection Time) 1-262
 runcnf (Run Configuration) 1-263
 runrev (Run Revision) 1-264
 savecnf (Save Configuration) 1-265
 setfpevt (Set FastPAD Event Reporting) 1-267

About This Manual

This section discusses the objectives, audience, organization, and conventions of the *Cisco WAN Switching SuperUser Command Reference* publication.

Cisco documentation and additional literature are available in a CD-ROM package, which ships with your product. The Documentation CD-ROM, a member of the Cisco Connection Family, is updated monthly. Therefore, it might be more current than printed documentation. To order additional copies of the Documentation CD-ROM, contact your local sales representative or call customer service. The CD-ROM package is available as a single package or as an annual subscription. You can also access Cisco documentation on the World Wide Web at <http://www.cisco.com>, <http://www-china.cisco.com>, or <http://www-europe.cisco.com>.

If you are reading Cisco product documentation on the World Wide Web, you can submit comments electronically. Click **Feedback** in the toolbar, select **Documentation**, and click **Enter the feedback form**. After you complete the form, click **Submit** to send it to Cisco. We appreciate your comments.

Objectives

This publication gives instructions on how to use the command line interface to execute super user (privilege level 0) commands on the Cisco WAN switch nodes.

Audience

The super user commands apply to tasks that require deeper product knowledge and responsibility than the standard user commands. (For descriptions of the standard user commands, refer to the *Cisco WAN Switching Command Reference*.) The SuperUser commands, for example, let you

- Configure statistics gathering and alarm reporting
- Display more varied and extensive statistics
- Perform software and firmware upgrades
- Troubleshoot at a level that requires deeper product knowledge

WAN Switch Product Name Change

The Cisco WAN Switch products have new names. Any switch in the BPX switch family (Cisco BPX® 8620 broadband switch and Cisco BPX® 8650 broadband switch) is now called a Cisco BPX® 8600 series broadband switch. The BPX Service Node switch is now called the Cisco BPX® 8620 broadband switch. The BPX switch as a Tag switch controller is now called the Cisco BPX® 8650 broadband switch. The AXIS shelf is now called the Cisco MGX™ 8220 edge concentrator. Any switch in the IGX switch family (IGX 8, IGX 16 and IGX 32 wide-area switches) is now called the Cisco IGX™ 8400 series multiband switches. The IGX 8 switch is now called the Cisco IGX™ 8410 multiband switch. The IGX 16 switch is now called the Cisco IGX™ 8420 multiband switch, and the IGX 32 switch is now called the Cisco IGX™ 8430 multiband switch. Cisco StrataView Plus is now called Cisco WAN Manager.

Organization

The main body of this publication is as follows:

- Chapter 1, “SuperUser Commands”

Conventions

This publication uses the following conventions to convey instructions and information.

Command descriptions use these conventions:

- Commands and keywords are in **boldface**.
- Required command arguments are in angle brackets (< >).
- Optional command arguments are in square brackets ([]).
- Arguments for which you supply values are in *italics*.
- Optional arguments are grouped and separated by vertical bars (|).

Examples use these conventions:

- Terminal sessions and information the system displays are in `screen font`.
- Information you enter is in **boldface screen font**.
- Nonprinting characters, such as passwords, are in angle brackets (< >).
- Default responses to system prompts are in square brackets ([]).

Note Means *reader take note*. Notes contain helpful suggestions or references to materials not contained in this manual.

Caution Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Cisco Connection Online

Cisco Connection Online (CCO) is Cisco Systems' primary, real-time support channel. Maintenance customers and partners can self-register on CCO to obtain additional information and services.

Available 24 hours a day, 7 days a week, CCO provides a wealth of standard and value-added services to Cisco's customers and business partners. CCO services include product information, product documentation, software updates, release notes, technical tips, the Bug Navigator, configuration notes, brochures, descriptions of service offerings, and download access to public and authorized files.

CCO serves a wide variety of users through two interfaces that are updated and enhanced simultaneously: a character-based version and a multimedia version that resides on the World Wide Web (WWW). The character-based CCO supports Zmodem, Kermit, Xmodem, FTP, and Internet e-mail, and it is excellent for quick access to information over lower bandwidths. The WWW version of CCO provides richly formatted documents with photographs, figures, graphics, and video, as well as hyperlinks to related information.

You can access CCO in the following ways:

- WWW: <http://www.cisco.com>
- WWW: <http://www-europe.cisco.com>
- WWW: <http://www-china.cisco.com>
- Telnet: [cco.cisco.com](telnet://cco.cisco.com)
- Modem: From North America, 408 526-8070; from Europe, 33 1 64 46 40 82. Use the following terminal settings: VT100 emulation; databits: 8; parity: none; stop bits: 1; and connection rates up to 28.8 kbps.

For a copy of CCO's Frequently Asked Questions (FAQ), contact cco-help@cisco.com. For additional information, contact cco-team@cisco.com.

Note If you are a network administrator and need personal technical assistance with a Cisco product that is under warranty or covered by a maintenance contract, contact Cisco's Technical Assistance Center (TAC) at 800 553-2447, 408 526-7209, or tac@cisco.com. To obtain general information about Cisco Systems, Cisco products, or upgrades, contact 800 553-6387, 408 526-7208, or cs-rep@cisco.com.

SuperUser Commands

Introduction

This chapter contains detailed descriptions of the Cisco WAN switching software SuperUser commands for Release 9.2. The Cisco WAN switching software SuperUser command descriptions appear in alphabetical order. You need user privilege level 0 (zero) to use these commands.

Caution These commands are intended to be restricted to Cisco personnel and other qualified users, such as system administrators. Do not distribute this information to casual users because using some super user commands improperly could lead to system malfunction or complete failure.

Also note that once you log into a node as SuperUser (user privilege level 0), you will have access to all the SuperUser commands in this guide throughout the entire session until you log off that node.

General Information

Note To use the SuperUser commands (privilege level 0), you need a different login and password than when you use commands with privilege levels 1–6.

Because the privilege level for all super user commands is 0, the privilege level does not appear in the command definition.

Table 1-1 lists the Cisco WAN switch software level 0 (SuperUser) commands in alphabetical order. The table also lists the nodes on which each command is available and whether you can include the command in a job. To access these commands, type in **SuperUser** at the login prompt. Enter the super user password and the password prompt. To exit a command at any point, press the Delete key.

The screen examples in this chapter are based on a network containing an IGX or BPX or any combination of these nodes. For detailed descriptions of commands requiring a user-privilege level in the range 1–6, refer to the *Cisco WAN Switching Command Reference*.

Note Some SuperUser commands rarely are applicable, while misusing other SuperUser commands can cause serious problems in the network. For these commands, the descriptions contain an advisory for you to call the Cisco Technical Assistance Center (TAC) before you proceed. The number in the United States is 800 553-2447. For international access, use 1-408 526-4000.

Descriptions for Statistics CLI Commands

This section briefly describes the statistics CLI (command line interface) descriptions that are provided for various statistics commands (for example, **cnfchstats**, **cnflnstats**, **cnfportstats**, and so on.) Each statistics command displays various field names on the CLI. Note that the descriptions provided in the various statistics description tables may vary from the actual description of the field name as it appears on the switch software command line interface statistics screens.

Only BXM card statistics descriptions are provided; however, note that many of the UXM card statistics are similar or identical to those used for the BXM card. This means that in many cases, the description may also apply to the UXM card. Note also that the statistics descriptions provided in the various tables may not always map directly to the CLI field names, but in many cases, they provide a description of the statistic that is sent from the card firmware to the switch software CLI (through ComBus messages from the firmware to switch software).

Note The BXM ComBus interface is similar in many places to the ComBus interface for previously-released cards (ASI and BNI cards). Note that there are small differences in the ComBus definition for other cards. In some cases the object ID for the BXM card statistic differs from its ASI or BNI counterpart.

Statistics Command Descriptions

There are several tables provided, which contain ComBus messages, along with descriptions of how each message is used by the switch software. Note that in many cases, the ComBus message description provides a description of the statistics field name on the CLI screen display, on **dspchstats**, **dspchstathist**, and so on.

The tables have the following columns:

- **ID**—Indicates the object ID number.
- **Object Name**—Provides a description of the object.
- **Range/Values**—Indicates the legal values that the object can take.
- **Default**—Indicates the default value used by the firmware if this object is not sent. Special defaults: s
 - R—Indicates that there is no default and the object must be supplied each time.
 - RI—Indicates that the object is required only at initial setup time.
 - NA—Not Applicable; Indicates that the object is “get-only” so a default value does not apply in this case.
 - NC—No Change.
 - LR—Line Rate (E3, DS3, OC-3, OC-12).
- **Description**—Indicates the use of the object.

Functional Description of Channel Statistics

This operation provides a way for the software to collect channel statistics. The number of channels statistics that can be collected is limited and configurable by software. Note that all of these statistics are not available on the Monarch firmware at one time. For the statistics that are not configured, a value of zero will be returned during the “get” operation.

In the description column, the numbers in brackets indicate how many stats-per-connection need to be configured on the card for the specific statistic to be available over the ComBus interface. [ALL] indicates the statistic is available regardless of the number of configured stats-per-connection. If the number inside the []s is preceded by “A:”, that means that the statistic is available when primary statistics are requested for the connection. If the number inside the []s is preceded by “B:”, that means the statistic is available when secondary statistics are requested for the connection.

Table 1-1 List of SuperUser Commands

Command	Description	Job	IGX	BPX
burnfwrev	Burn Firmware Revision	Yes	X	X
clrcderrs	Clear Detailed Card Errors Log	Yes	X	X
clrcnf	Clear Configuration Memory	No	X	X

tststats	Test Statistics	No	X	X
tstubus	Test UBU Allocation Spacing	Yes		
upggrp	Upgrade Groups	No	X	X

burnfwrev (Burn Firmware Image into Card(s))

The **burnfwrev** command burns a new firmware image into a specific card.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dspfwrev, **getfwrev**

Syntax

burnfwrev <image name> <slot number>

- | | |
|---------------|--|
| <image name> | Specifies the name of the firmware image to burn. You should typically enter image names in all capital letters; also, image names are case-sensitive. |
| <slot number> | Specifies the shelf slot where the card to burn is located. Specifying slot 0 will burn all cards of the appropriate type at the local node. |

Function

This command is used to burn a firmware image into the memory of a specific card. Before you use **burnfwrev**, the firmware image must already reside in the controller card's memory. (Use **getfwrev** to load the image to the controller.)

A few seconds after you enter **burnfwrev**, the system displays a screen similar to that shown in Figure 1-1, then the Burn Address column starts to indicate the addresses that are being “burned.” When **burnfwrev** finishes, the status changes to “Complete.”

After all cards at a node have been updated with **burnfwrev**, enter the following to clear the firmware image from the controller card's buffer area:

```
getfwrev 0.0 node_name
```

Use the **dspfwrev** command to display the firmware image status on the controller card at any time after **burnfwrev** has finished.

At the super user level (0), you can use **burnfwrev** only to change the *revision level* of a card's firmware. If the firmware revision would result in a new *model number* for the card, only a user with a higher privilege level can burn the firmware image. In this case, you would have to call the TAC to execute the command.

Figure 1-1 burnfwrev—Burn Firmware Revision into Card

gamma TRM SuperUser Rev: 9.2 Aug. 17 1998 14:28 PDT

Firmware Size Status

Continue?

clrcderrs (Clear Detailed Card Errors)

The **clrcderrs** command clears the history of card failures (errors) associated with the specified slot.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dspcderrs, prtcderrs

Syntax

clrcderrs <slot number | *>

<slot number | *> Specifies the slot number to clear. A "*" can be entered to clear all cards.

Function

This command clears the history of card failures associated with the specified slot. When you enter this command system responds with Slot Number or *. After you enter the command, the system asks you to confirm that it is OK to clear this data.

For example, to clear the data from the FRM card in slot 3, enter the command illustrated in Figure 1-2. This screen also illustrates the card's stored data.

Figure 1-2 clrcderrs—Clear Card Errors (before confirmation)

Next Command:
```

clrcnf (Clear Configuration Memory)

The **clrcnf** command clears the configuration memory at the current node and resets the node.

Attributes

Jobs: No Log: No Lock: Yes Node Type: IGX, BPX

Associated Commands

loadcnf, **runcnf**, **savecnf**

Syntax

clrcnf

Function

The **clrcnf** command erases most network configuration data. This configuration data includes connections, trunks, circuit lines, and so on, for the local node. You may need to use the **clrcnf** command when you upgrade the network with a new software release or when you move a node. A warning and a confirmation prompt appear before the command executes. Figure 1-4 illustrates a typical screen.

This command should be used only on a node that has not yet been placed in service or when the network configuration has been previously saved so it can be quickly reloaded. The configuration can be saved in one of several ways:

- On a Cisco WAN Manager terminal using the **savecnf** command. The node is then reloaded using the **loadcnf** command.
- On a standby controller card. Before entering the **clrcnf** command, remove the standby controller from its slot. The configuration data will be maintained in BRAM even though the power has been removed from the card.

Caution Use **clrcnf** with extreme caution. Typically, you should use **clrcnf** only if the Cisco TAC has instructed you to do so. This command can make the node unreachable to the network.

Figure 1-4 **clrcnf—Clear Node Configuration**

```
*** Warning: ***
This command clears the configuration memory and resets the Node.
```

```
This Command: clrcnf
```

```
Are you sure (y/n)?
```

clrfpevt (Clear FastPAD Event Reporting)

The **clrfpevt** command disables the reporting of FastPAD events.

Attributes

Jobs: No Log: Yes Lock: No Node Type: IGX

Associated Commands

setfpevt, **dsplog**

Syntax

```
clrfpevt <FastPAD name> | <slot.port>
```

Function

The reason for executing **clrfpevt** is to prevent the large number of logged events that accumulate when certain user-controlled disruptions occur. Without suspension of event-logging, the number of events caused by the disruption can cause the FastPAD to become unreachable. Remember to resume event logging by using the **setfpevt** command. Examples of these events are:

- FTM Y-cable switchover
- NPM/NPC switchover
- Adding a connection by using the **addfrcons** command
- Resetting the FastPAD (power cycling or by the **resetfp** command)

Example

```
clrfpevt 9.3
```

Description

The example command halts event logging for the FastPAD connected to port 9.3.

Note No screen appears when **clrfpevt** executes. The example shows the **dsplog** output after a sequence of **clrfpevt** then **setfpevt**. Earlier FastPAD events appear near the bottom of the screen.

Figure 1-5 clrfpevt—Clear FastPAD Event Reporting

cnfabrparm (Configure Assigned Bit Rate Queue Parameters)

The **cnfabrparm** command configures parameters for the ABR (Assigned Bit Rate) queue on all ports on the selected UXM.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfportq, dspportq, cnfport, dspport

Syntax

cnfabrparm <slot> <CI_control> <ER_control>

- | | |
|--------------|--|
| <slot> | Specifies the slot number of the UXM. |
| <CI_control> | Enables or disables Egress/Ingress Congestion Information control. |
| <ER_control> | Enables or disables ABR RM cell Explicit Rate stamping. |

Function

The **cnfabrparm** command lets you toggle the Egress/Ingress Congestion Information control and/or the ABR RM cell Explicit Rate stamping parameters on and off. All ports on the UXM in the selected slot are dynamically reconfigured according to the new parameters.

Example

```
sw205          TN      SuperUser      IGX 8420      9.2      Jan. 27 1998 04:50 GMT

```

```
CI Control      : N
```

```
Egress ER Stamping : N
```

```
This Command: cnfabrparm 5
```

cnfbusbw (Configure UXM Card Bus Bandwidth)

The **cnfbusbw** command configures the amount of bandwidth allocated on the bus for a UXM card.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

dspbusbw (a standard user command)

Syntax

cnfbusbw <slot>

<slot>	Specifies the slot number of the UXM.
<bw>	Specifies the amount of bandwidth to be allocated in UBUs (which the system converts to either FastPackets per second or cells per second. The maximum rate you can set is 288000 cells per second, which is 72 UBUs. Each UBU is the equivalent of 4000 cells per second.

Function

The **cnfbusbw** command lets you configure the amount of bandwidth allocated on the bus for the selected UXM. The default amount of bus bandwidth allocated depends on the connection type you are adding. 77 Mbps (1/2 OC-3 rate) of bus bandwidth is allocated to an OC-3 port card when the first line is upped. For the T3/E3 line, 44/34 Mbps (T3/E3 rate) is allocated as default bus bandwidth. For a T1/E1 line, the amount of bandwidth allocated will be enough for all T1/E1 lines supported on the card. After the default bus bandwidth is allocated, the system will not allocate any more bus bandwidth to the card when you activate more lines, so you must manually allocate the bus bandwidth to the card using the **cnfbusbw** command. Table 1-2 lists the **cnfbusbw** screen information. All ports on the UXM in the selected slot are dynamically reconfigured according to the new parameters.

Table 1-2 cnfbusbw—Screen Information

Display	Description
Minimum Required Bandwidth	Minimum bandwidth in FastPackets per second and cells per second required for all connections currently configured on this card. This is calculated by UXM firmware as connections are added.
Maximum Port Bandwidth	Total bandwidth of all active trunks/ports on this card in FastPackets per second, cells per second and UBUs.
Average Bandwidth and Peak Used Bandwidth	Statistics counters maintained by UXM firmware. These statistic counters display FastPackets per second, cells per second and UBUs. Use this information when calculating the amount of Bus Bandwidth to be allocated. These counters will be cleared when the UXM card is reset.

Table 1-2 cnfbusbw—Screen Information (Continued)

Display	Description
Last Updated time	Shows the time when the counters were last updated. This will be the current time if you answered yes to the <code>Get updated bandwidth info from card (Y/N)?</code> prompt or entered the command with the <code>u</code> parameter.
Allocated Bandwidth	The bandwidth allocated for this card using the <code>cnfbusbw</code> command. Allocated bandwidth is specified in UBU units and converted to either FastPackets per second or cells per second by the system.

Figure 1-6 cnfbusbw (Configure UXM Card Bus Bandwidth)

This Command: cnfbusbw 5

Allocated UBU count:

```

cnfcdparm

Use the **cnfcdparm** command to configure the channel statistic level on the BXM/UXM card. This command supports the multilevel channel statistics feature, which lets you configure and display additional levels of statistics on a BXM or UXM card.

Configuration of the channel statistic level is a slot-based parameter. For example, if slot 5 is configured to support level 3 channel statistics, all connections on the card in slot 5 will be set to level 3 statistics.

The multilevel Channel Statistics feature is supported on the BPX and IGX platforms, for BXM and UXM cards. (Refer to release notes for card firmware release requirements.) The Multilevel Channel Statistics feature requires switch software to collect, display and propagate to Cisco WAN Manager the various statistics types. The channel statistic types vary in number and type based upon the level of support provided by the BXM and UXM cards.

Apart from the **cnfcdparm** command which you use to configure the channel statistic level on the BXM/UXM cards, you configure and use the BXM/UXM channel statistics similarly as in previous releases. You use the following commands to configure BXM and UXM card statistics:

- Summary Statistics Commands: **dspchstats**, **clrchstats**
- Interval Statistics Commands: **dspchstathist**, **dspchstatcnf**, **cnfchanstats** (statistics information collected by these commands is sent to Cisco WAN Manager).
- Line and Trunk Management Commands: **upln**, **uptrk**

Description of Summary and Interval Statistics

Summary statistics are also referred to as real-time statistics or real-time measurements. These statistics show their values updating in real time, for example, the counter for the number of cells transmitted increment as you are watching. Commands you use to view real-time statistics are **dsprkstats**, **dspportstats**, and **dspchstats**.

Interval statistics is a general name for three specific statistic types: TFTP statistics, AUTO statistics, and USER statistics. They are also commonly referred to as detailed statistics or history statistics. Interval statistics show historical information, for example, the number of cells transmitted in the previous 30 minutes.

Commands you use to view the enabled interval statistics are: **dspchstatcnf**, **dsplnstatcnf**, **dspportstatcnf**, **dsprkstatcnf**, and **dspslotstatcnf**.

Commands you use to view a single enabled interval statistic in detail are: **dspchstathist**, **dsplnstathist**, **dspporstathist**, and **dsprkstathist**.

You can enable the TFTP statistics by using the debug command (**cnfstatparms** or from the Cisco WAN Manager Statistics Collection Manager (SCM). (Note that you need to have either Service or SuperUser level access to use debug commands.) When they are enabled, all objects that can support an enabled statistic will attempt to do so. For example, if enabling trunk statistic #5, all trunks that can support trunk statistic #5 will attempt to enable it. These statistics are generally used for billing, and monitoring the network's performance.

AUTO statistics, also referred to as IGX or BPX feature statistics, are used for the switches' statistical alarming feature. As their name implies, these statistics are automatically allocated when certain statistical entities are upped or added. Auto stat entries on the IGX are ADPCM, ADPNO, PCM, Transparent and Data connections, as well as trunks and lines. Auto statistic entities on the BPX are trunks, lines, and cards.

USER statistics are statistics enabled through the following commands: **cnfrkstats**, **cnflnstats**, **cnfportstats**, **cnfchstats** and **cnfslotstats**. When these statistics are enabled, they are enabled on a specified entity; for example, enabled trunk statistic #5 on trunk 4.2. User statistics are mainly used for debugging.

Multilevel Channel Statistics Support

Previous to Release 9.2, switch software only supported a subset of channel statistics available on the BXM or UXM cards, sometimes referred to as “level 1 statistics.” Because the BXM and UXM cards can potentially support a larger number of channel statistics, additional levels (levels 2 and 3) of statistics are now supported in Release 9.2. The number of statistics available are based upon the statistics level programmed on the BXM or UXM card.

Release 9.2 of switch software and Cisco WAN Manager support additional channel statistics on the BXM/UXM cards. These statistics are available as summary and interval statistics. (The “interval” commands **dspchstathist**, **dspchstatcnf**, and **cnfchanstats** commands are available through the switch software CLI. Additionally, statistics information collected by the interval commands is also sent to Cisco WAN Manager.) The set of Real Time Counters statistics supported are the same as previous to Release 9.2.

Table 1-3 lists the channel statistics available on the BXM and UXM cards. The four different levels supported are shown, along with the statistics field description as it appears on the related statistics screens (**dspchstats**, **cnfcdparm**, **clrchstats**, **dspchstathist**, **dspchstatcnf**, **cnfchanstats**). Refer to Table 1-6 for descriptions of the channel statistics listed in Table 1-3.

Table 1-3 Channel Statistics Available on BXM and UXM Cards

Level 0	Level 1	Level 2	Level 3
No Stats	Rx Cells from port	All level 1	All Level 2
	RX EOF's from port	TX EFCI 1 to Port	RX EFCI 1 from Port
	RX cells to NW	RX CLP0 to NW	RX EFCI 0 from Port
	Rx CPL1 from port	RX CLP1 to NW	TX EFCI 0 from NW
	RX cells Non-cmplt	TX EFCI 0 to Port	TX EFCI 1 from NW
	RX CLP0 Non-cmplt	RX EFCI 0 to NW	
	RX CLP1 Non-cmplt	RX EFCI 1 to NW	OAM from Port
	Ingress VC Q depth	TX EOFs to Port	RM Cells from Port
	TX cells from NW		RM From NW
	TX CLP1 to Port	RX EOF CNG DSC	OAM From NW
	TX Cells to Port		RM Cells to Port
	RX CLP0 Cng Dscd		Rx EFCI 0 Cng Dsc
	RX CLP1 Cng Dscd		Rx EFCI 1 Cng Dsc
	RX CLP0 from Port		Rx OAM Cng Dsc
	TX CLP0 Cells to Port		Rx RM Cng Dsc
	TX CLP0 from NW		Rx FRM to NW
	TX CLP1 from NW		Rx BRM/Fst to NW
	Ingress VSVD ACR		Tx EFCI 0 Cng Dsc
	Egress VSVD ACR		Tx EFCI 1 Cng Dsc

Table 1-3 Channel Statistics Available on BXM and UXM Cards (Continued)

Level 0	Level 1	Level 2	Level 3
	Egress VC Q Depth		Tx RM Cng Dsc
			Tx OAM Cng Dsc
	*TX CLP 0 Dscd		
	*TX CLP 1 Dscd		
	*TX CLP0+1 Dscd		
	*RX CLP0+1 from prt		
	*OAM State		
	* indicates summary stats only		

The BXM and UXM cards can be configured for multilevel channel statistics collection. You configure the channel statistic levels by using the **cnfcdparm** command. You can configure the channel statistics level only on a standby card. If you attempt to execute the **cnfcdparm** command on an active controller card, you will get a warning telling you that you cannot use the **cnfcdparm** on an active card.

The **cnfcdparm** command allows you to set the statistic level on a UXM or BXM card. However, **cnfcdparm** command will not allow you to change the statistics level if the card is active. The switch software detects the current channel statistics level available on the UXM or BXM card. Also, switch software performs the following card mismatch verification:

- When a card is inserted, if the channel statistic level decreases from the entry in the logical card database, the card will mismatch.
- When a card is inserted, if the channel statistic level increases from the entry in the Logical Card database, the card will not mismatch. The logical card database will NOT be updated with the increased channel statistic level value, and you will only have available the number of statistics described on the primary card.
- During the Y-cable mismatch verification, if the secondary card has a smaller channel statistic level, then the primary card (logical card) and the secondary card will mismatch.
- During the Y-cable mismatch verification, if the channel statistic level is larger on the secondary card, the card will not mismatch. The Y-cable will continue to operate based on the number of statistics available on the primary/logical card.

UXM/BXM multilevel Channel Statistics Feature

The multilevel Channel Statistics feature supports the following functions in card management, channel statistics, and Cisco WAN Manager:

Card Management

- Recognizing card support for new feature
- Support for reconfiguration of channel statistics levels
- Support for y-redundant configuration
- Mismatch checking
- Support for upgrade of new feature on current configurations

Channel Statistics

- Support for channel statistics on cards that do not support multilevel statistics
- Support for port channel statistics on cards that support multilevel statistics
- Support for trunk channel statistics on cards that support multilevel statistics

Cisco WAN Manager

- Cisco WAN Manager will be informed about changes in card's channel statistics level
- Cisco WAN Manager will be informed about enabled channel statistics on a statistics level basis
- Correct TFTP channel statistics are enabled after an upgrade to multilevel statistics

Cisco WAN Manager

Cisco WAN Manager supports the Multilevel Channel Statistics as provided by the BXM and UXM cards.

Channel Statistics Collection and Display

The Multilevel Channel statistics are similar to the statistics supported on the current BXM and UXM cards. These channel statistics are accumulated in a historical format using the same collection technique as the current channel statistics. You configure the interval statistics by using the **cnfchstats** command, and display them by using the **dspchstathist** command. In addition, you can get summary statistics by using the **dspchstats** command. You display the additional channel statistics screens by either pressing Return or “y” for yes, depending on whether you are on a BPX or IGX node.

The actual number of statistics available is based on the channel statistics level you configure by using the **cnfcdparm** command.

You use the following CLI commands to configure and display channel statistics:

- **cnfchstats**
- **dspchstatcnf**
- **dspchstathist**
- **dspchstats**

Memory Requirements

Additional memory is required to support channel summary statistics on the BPX and IGX platforms.

BPX Platform

132,000 bytes = (33 new stats) * (1000 summary stat entries) * (4 bytes per stat entry)

IGX Platform

112,000 bytes = (8 new stats) * (3500 summary stat entries) * (4 bytes per stat entry)

Table 1-4 list the current controller card memory configurable parameters, and Table 1-5 lists the BPX polling intervals and number of connections supported.

Table 1-4 Maximum Statistics Memory per Controller Card

Control Card	TFTP/User Memory
BCC 32	610K
BCC 64	12.7M
NPM 32	2.0M
NPM 64	12.7M

Table 1-5 BPX Polling Interval

Connections Supported	Polling Interval
1-3999 conns	5 minutes
4000-7999 conns	10 minutes
9001-12,000 conns	15 minutes

Table 1-6 lists the BXM/UXM channel statistics object name, levels and descriptions provided in Release 9.2.

Note In most cases, the statistic's object name is similar or identical to the statistic's field name as it appears at the CLI.

Table 1-6 BXM/UXM Channel Statistics Names, Levels, and Descriptions

Object ID	Object Name	Level	Range/Values	Description
05	Rx Cells From Port	1	0 - $2^{32}-1$	Number of cells received at the ingress of the connection. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
06	Rx EOFs From Port	1	0 - $2^{32}-1$	Number of EOFs received at the ingress of the connection. [A:ALL, B:12, B:28]
07	Rx Cells to Backplane	1	0 - $2^{32}-1$	Number of cells rx'd at the ingress that were sent to the backplane. [A:ALL, B:ALL]
08	Rx CLP=1 Cells From Port	1	0 - $2^{32}-1$	Number of cells received at the port with CLP=1. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
09-0B	RESERVED			
0C	Rx EFCI=1 Cells From Port	3	0 - $2^{32}-1$	Number of cells received at the port with EFCI=1. [A:28, B:28]
0D	RESERVED			

Table 1-6 BXM/UXM Channel Statistics Names, Levels, and Descriptions (Continued)

Object ID	Object Name	Level	Range/Values	Description
0E	Non-Compliant Cell Count (Total)	1	0 - 2 ³² -1	Number of cells received at the ingress of the connection that were non-compliant discarded. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware—it can wrap in less than a second depending upon non-compliant rate.)
0F	Non-Compliant Cell Count (CLP 0 Only)	1	0 - 2 ³² -1	Number of CLP 0 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware—it can wrap in less than a second depending upon non-compliant rate.)
10	Non-Compliant Cell Count (CLP 1 Only)	1	0 - 2 ³² -1	Number of CLP 1 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware—it can wrap in less than a second depending upon non-compliant rate.)
11	Ingress VC Q Depth	1	0 - 2 ³² -1	Current Ingress VC Queue Depth. [A:ALL, B:ALL]
12-14	RESERVED			
15	Rx Rsrc Ovfl Discards	N.A.	0 - 2 ³² -1	Number of cells received at the port that were discarded due to Resource Overflow. [B:ALL]
16-1E	RESERVED			
1F	Tx Cells From Network	1	0 - 2 ³² -1	Number of cells received from the backplane. [A:ALL, B:ALL]
20	Tx CLP=1 To Port	1	0 - 2 ³² -1	Number of cells transmitted out the port with CLP=1. [A:ALL, B:12, B:28]
21	Tx EFCI=1 To Port	2	0 - 2 ³² -1	Number of cells transmitted out the port with EFCI=1. [A:12, A:28, B:12, B:28]
22	Tx Cells To Port	1	0 - 2 ³² -1	Number of cells transmitted out the port. [A:ALL, B:ALL]
23-26	RESERVED			
27	Loopback RTD Measurement	N.A.	0 - 2 ³² -1	The Loopback Round Trip Delay measurement in msec. (Still under investigation.) Used to initiate the measurement (Set). The Get is used to get the last measurement known; or zero if now known.
28	Local Ingress Rx State	1	0 : Okay 1 : FERF (aka RDI) 2 : AIS	The OAM connection state. [A:ALL, B:ALL]
29	Rx CLP=0 Congested Discards	1	0 - 2 ³² -1	Number of CLP=0 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]
2A	Rx CLP=1 Congested Discards	1	0 - 2 ³² -1	Number of CLP=1 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]

Table 1-6 BXM/UXM Channel Statistics Names, Levels, and Descriptions (Continued)

Object ID	Object Name	Level	Range/Values	Description
2B	Rx CLP=0 Cells From Port	1	0 - $2^{32}-1$	Number of CLP=0 Cells received from the port. [A:ALL, B:ALL] (NOTE: This stat is received from the RCMP.)
2C	Tx CLP=0 Cells To Port	1	0 - $2^{32}-1$	Number of CLP=0 Cells transmitted to the port. [A:ALL, B:12, B:28]
2D	Tx CLP=0 Cells From Backplane	1	0 - $2^{32}-1$	Number of CLP=0 Cells received from the backplane. [A:ALL, B:28]
2E	Rx CLP=0 Cells To Backplane	2	0 - $2^{32}-1$	Number of CLP=0 Cells sent to the backplane. [A:ALL, B:12, B:28]
2F	Tx CLP=1 Cells From Backplane	1	0 - $2^{32}-1$	Number of CLP=1 Cells received from the backplane. [A:ALL, B:28]
30	Rx CLP=1 Cells To Backplane	2	0 - $2^{32}-1$	Number of CLP=1 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
31	Rx EFCI=0 Cells From Port	3	0 - $2^{32}-1$	Number of EFCI=0 Cells received from the port. [A:28, B:28]
32	Tx EFCI=0 Cells To Port	2	0 - $2^{32}-1$	Number of EFCI=0 Cells transmitted to the port. [A:12, A:28, B:12, B:28]
33	Tx EFCI=0 Cells From Backplane	3	0 - $2^{32}-1$	Number of EFCI=0 Cells received from the backplane. [A:28, B:28]
34	Rx EFCI=0 Cells To Backplane	2	0 - $2^{32}-1$	Number of EFCI=0 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
35	Tx EFCI=1 Cells From Backplane	3	0 - $2^{32}-1$	Number of EFCI=1 Cells received from the backplane. [A:28, B:28]
36	Rx EFCI=1 Cells To Backplane	2	0 - $2^{32}-1$	Number of EFCI=1 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
37	Tx EOFs to Port	2	0 - $2^{32}-1$	Number of cells with EOF sent to the port. [A:12, A:28, B:28]
38	Tx EOFs from Backplane	N.A.	0 - $2^{32}-1$	Number of EOFs received at the backplane. [B:12, B:28]
39	Rx EOFs to Backplane	N.A.	0 - $2^{32}-1$	Number of cells with EOF sent to the backplane. [B:28]
3A	Rx Segment OAM	3	0 - $2^{32}-1$	Number of Segment OAM cells received at the port. [A:28, B:28]
3B	Tx Segment OAM	3	0 - $2^{32}-1$	Number of Segment OAM cells received at the egress. [A:28, B:28]
3C	Rx End-to-End OAM	3	0 - $2^{32}-1$	Number of End-to-End OAM cells received at the port. [A:28, B:28]
3D	Tx End-to-End OAM	3	0 - $2^{32}-1$	Number of End-to-End OAM cells received at the egress. [A:28, B:28]
3E	Rx Forward RM Cells	3	0 - $2^{32}-1$	Number of Forward RM cells received at the port. [A:28, B:28]
3F	Tx Forward RM Cells	3	0 - $2^{32}-1$	Number of Forward RM cells received at the backplane. [A:28, B:28]
40	Rx Backward RM Cells	3	0 - $2^{32}-1$	Number of Backward RM cells received at the port. [A:28, B:28]

Table 1-6 BXM/UXM Channel Statistics Names, Levels, and Descriptions (Continued)

Object ID	Object Name	Level	Range/Values	Description
41	Tx Backward RM Cells	3	0 - 2 ³² -1	Number of Backward RM cells received at the backplane. [A:28, B:28]
42	Rx Optimized Bandwidth Management RM Cells	N.A.	0 - 2 ³² -1	Number of Optimized Bandwidth Management RM cells received at the port. [B:28]
43	Tx Optimized Bandwidth Management RM Cells	N.A.	0 - 2 ³² -1	Number of Optimized Bandwidth Management RM cells received at the backplane. [B:28]
44	Rx Undefined RM Cells	N.A.	0 - 2 ³² -1	Number of Undefined RM cells received at the port. [B:28]
45	Tx Undefined RM Cells	N.A.	0 - 2 ³² -1	Number of Undefined RM cells received at the backplane. [B:28]
46	Tx Rsrc Ovfl Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the backplane that were discarded due to Resource Overflow. [B:ALL]
47	Rx VI Cell Discards	N.A.	0 - 2 ³² -1	Number of cells received at the port that were discarded because of a full Vi. [B:12, B:28]
48	Tx VI Cell Discards	N.A.	0 - 2 ³² -1	Number of cells rx'ed at the backplane discarded because of a full Vi. [B:12, B:28]
49	Rx QBIN Cell Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the port discarded due to QBIN threshold violation. [B:12, B:28]
4A	Tx QBIN Cell Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the backplane that were disc. due to QBIN thres. violations. [B:12, B:28]
4B	Rx VC Cell Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the port that were disc. due to VC thres. violations. [B:12, B:28]
4C	Tx VC Cell Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the backplane that were discarded due to VC threshold violations. [B:ALL]
4D	Rx Cell Filter Discards	N.A.	0 - 2 ³² -1	Number of cells received at the port that were discarded due to cell filter action. [B:12, B:28]
4E	Tx Cell Filter Discards	N.A.	0 - 2 ³² -1	Number of cells rx'd at the backplane that were discarded due to cell filter action. [B:12, B:28]
4F	Rx Illegal Event Cells	N.A.	0 - 2 ³² -1	Number of cells rx'd at the port that caused an reserved event in the hardware. [B:28]
50	Tx Illegal Event Cells	N.A.	0 - 2 ³² -1	Number of cells rx'd at the backplane that caused an reserved event in the H/W. [B:28]
51	Ingress VSVD ACR	1	0 - 2 ³² -1	Ingress VSVD allowed Cell Rate. [A:ALL, B:ALL]
52	Egress VSVD ACR	1	0 - 2 ³² -1	Egress VSVD allowed Cell Rate. [A:ALL, B:ALL]
53	Egress VC Q Depth	1	0 - 2 ³² -1	Current Egress VC Queue Depth. [A:ALL, B:ALL]
54	Bkwd SECB	N.A.	0 - 2 ³² -1	Backward reporting Performance Monitoring Severely Errored Cell Blocks. [A:ALL, B:ALL]

Table 1-6 BXM/UXM Channel Statistics Names, Levels, and Descriptions (Continued)

Object ID	Object Name	Level	Range/Values	Description
55	Bkwd Lost Cells	N.A.	0 - 2 ³² -1	Backward reporting Performance Monitoring Lost Cell Count. [A:ALL, B:ALL]
56	Bkwd Misinserted Cells	N.A.	0 - 2 ³² -1	Backward reporting Performance Monitoring Misinserted Cell Count. [A:ALL, B:ALL]
57	Bkwd BIPV	N.A.	0 - 2 ³² -1	Backward reporting Performance Monitoring Bipolar Violation Count. [A:ALL, B:ALL]
58	Fwd SECB	N.A.	0 - 2 ³² -1	Forward reporting Performance Monitoring Severely Errored Cell Blocks. [A:ALL, B:ALL]
59	Fwd Lost Cells	N.A.	0 - 2 ³² -1	Forward reporting Performance Monitoring Lost Cell Count. [A:ALL, B:ALL]
5A	Fwd Misinserted Cells	N.A.	0 - 2 ³² -1	Forward reporting Performance Monitoring Misinserted Cell Count. [A:ALL, B:ALL]
5B	Fwd BIPV	N.A.	0 - 2 ³² -1	Forward reporting Performance Monitoring Bipolar Violation Count. [A:ALL, B:ALL]
5C-5F	RESERVED			
60	SAR Good PDUs Rcv	?	0 - 2 ³² -1	Number of good PDUs received by the SAR. [A:ALL, B:ALL]
61	SAR Good PDUs Xmt	?	0 - 2 ³² -1	Number of good PDUs transmitted by the SAR. [A:ALL, B:ALL]
62	SAR Rcv PDUs Discarded	?	0 - 2 ³² -1	Number of PDUs discarded on the ingress by the SAR. [A:ALL, B:ALL]
63	SAR Xmt PDUs Discarded	?	0 - 2 ³² -1	Number of PDUs discarded on the egress by the SAR. [A:ALL, B:ALL]
64	SAR Invalid CRC PDUs Rcvd	?	0 - 2 ³² -1	Number of invalid CRC32 PDUs received by the SAR. [A:ALL, B:ALL]
65	SAR Invalid Length PDUs Rcvd	?	0 - 2 ³² -1	Number of invalid-length PDUs received by the SAR. [A:ALL, B:ALL]
66	SAR Short Length Failures	?	0 - 2 ³² -1	Number of short-length failures detected by the SAR. [A:ALL, B:ALL]
67	SAR Long Length Failures	?	0 - 2 ³² -1	Number of long-length failures detected by the SAR. [A:ALL, B:ALL]
	TX FRM to Port	2	0 - 2 ³² -1	
	TX BRM and Fst to Prt	2	0 - 2 ³² -1	
	RX EOF Congestion Discard	2	0 - 2 ³² -1

	TX EFCI 1 Congestion Discard	3	0 - 2 ³² -1	
	TX RM Congestion Discard	3	0 - 2 ³² -1	
	TX OAM Congestion Discard	3	0 - 2 ³² -1	

Multilevel Statistics Supported on UXM Card

The initial release of the UXM firmware supported only four (4) QE per channel statistics. To support these new statistics, however, more QE memory, on a per channel basis, is required. As the statistics level is increased, the number of connections supported by the card may decrease.

Setting the Statistics Level on the UXM Card

Setting the statistics level can only be performed with the UXM in the standby state. See the switch software command **cnfcdparm** for details on how to set the statistics level on the card.

The UXM will retain the last setting and will reboot in that mode. That is, if the statistics were set to 2, the UXM, when reset (reinserted, and so on.), will boot with the statistics level set to 2. However, the lowest setting actually set on the card will be the maximum number of statistics with the maximum number of user connections. That is, the UXM can support 4 ingress and 4 egress QE statistics with 8,000 user connections. This would be the equivalent of the statistics level being set to 1. The cards will accept the full range of statistics levels (0-3). The UXMe (UXM Enhanced card) will support up to statistics level 2 with no reduction in the number of connections. Table 1-7 shows connection counts for the UXM cards when different statistics levels are configured on the card.

Table 1-7 Connection Counts for Various Statistics Levels on UXM

Statistics Level	UXM Conns	UXM FP Conns	UXMe Conns	UXMe FP Conns
0	8126	4000	8126	4000
1 (UXM default)	8126	4000	8126	4000
2 (UXMe default)	4031	4000	8126	4000
3	1983	1983	4031	4000

Levels of Support on UXM Card for Various Statistics

If statistics belonging to a statistics level higher than the level set on the card are requested, the user will receive an error message. The **bold** text refers to statistics collected from the QE. Statistics fall into four categories: User, Oam, Rm, and All. These categories can be further divided into types. User cells are one of four types: Eof0-EFCI0, Eof1-EFCI0, Eof0-EFCI1, and Eof1-EFCI1. OAM cells come in two types: SEg and E2e. RM cells fall into three types: FRm, BRm, and FsRm. CLP0 and CLP1 cells, when tracked, are only distinguished for User cells.

Table 1-8 shows the levels of statistics support that can be configured for the UXM card in Release 9.2.

Table 1-8 Levels of Support that can be Configured for Statistics on UXM Card

Ingress Statistics	Oid	Level	New	Definition
All Cells from port	0x05	All		
All CLP1 cells from port	0x08	All		
All non compliant cells	0x0E	All		
All CLP0 non compliant cells	0x0F	All		
All CLP1 non compliant cells	0x10	All		
VC queue depth	0x11	All		
All CLP0 cells from port	0x2B	All		
VSVD ACR	0x51	All		
EOF=1 from port	0x06	1->		All cells Eof= 1 that arrive at the QE from the port. This includes cells that are discarded due to overflow. Note: for Level 1 this does not include discards due to overflow.
All cells to NW	0x07	1->		Sum of CLP0 and CLP1 cells that arrive at the QE from the port.
CLP0 overflow discards	0x29	1->		All cells with CLP0 that are discarded at the QE due to overflow.
CLP1 overflow discards	0x2A	1->		All cells with CLP1 that are discarded at the QE due to overflow
CLP0 to NW	0x2E	2->	x	All cells with CLP0 which depart from the QE to the NW.
CLP1 to NW	0x30	2->	x	All cells with CLP1 which depart from the QE to the NW.

Table 1-8 Levels of Support that can be Configured for Statistics on UXM Card

Ingress Statistics	Oid	Level	New	Definition
EFCI=0 to NW	0x34	2->	x	All cells with EfcI=0 which depart from the QE to the NW.
EFCI=1 to NW	0x36	2->	x	All cells with EfcI=1 which depart from the QE to the NW.
EOF=1 overflow discards	0x0B	2->	x	All cells with Eof=1 which are discarded at the QE due to overflow.
EFCI=0 from port	0x31	3	x	All cells with EfcI=0 which arrive at the QE from the port. This includes cells which are discarded due to overflow.
EFCI=1 from port	0x0C	3	x	All cells with EfcI=1 which arrive at the QE from the port. This includes cells which are discarded due to overflow.
OAM cells from port	0x3A	3	x	OAM cells which arrive at the QE from the port. This includes cells which are discarded due to overflow.
Rm cells from port	0x3E	3	x	Rm cells which arrive at the QE from the port. This includes cells which are discarded due to overflow.
FRm to NW	0x17	3	x	FRm cells which depart from the QE to the NW.
BRm+FsRm to NW	0x18	3	x	BRm + FsRm cells which depart from the QE to the NW.
EFCI=0 overflow discards	0x12	3	x	All EfcI=0 cells which are discarded at the QE due to overflow.
EFCI=1 overflow discards	0x13	3	x	All EfcI=1 cells which are discarded at the QE due to overflow.
OAM overflow discards	0x14	3	x	All OAM cells which are discarded at the QE due to overflow.
RM overflow discards	0x16	3	x	All Rm cells which are discarded at the QE due to overflow.

Table 1-9 Consolidated Ingress Statistics (to UXM Card)

Consolidated Ingress Statistics	Oid	Part of Which New Stat	New Oid	Stat Grp
seg OAM from port	0x3A	OAM from port	0x3A	3
end to end OAM from port	0x3C	OAM from port	0x3A	3
FRm cells from port	0x3E	Rm cells from port	0x3E	3
BRm+FsRm cells from port	0x40	Rm cells from port	0x3E	3

Table 1-10 Egress Statistics (from UXM Card)

Consolidated Egress Statistics	Oid	Part of Which New Stat	New Oid	Stat Grp
FRm from NW	0x3F	Rm from NW	0x3F	3
BRm+FsRm from NW	0x41	Rm from NW	0x3F	3
seg OAM from NW	0x3B	OAM from NW	0x3B	3
end to end OAM from NW	0x3D	OAM from NW	0x3B	3
FRm cells to port	0x09	Rm cells to port	0x0A	3
BRm+FsRm cells to port	0x0A	Rm cells to port	0x0A	3

Compatibility with 9.1 Classic Statistics

The statistics as defined for Level statistics will not provide the same information as statistics on a UXM running 9.1 firmware. However, backward compatibility is provided for any UXM upgraded from 9.1 to 9.2 firmware. UXMs shipped with 9.2 firmware do not support the Classic statistics.

Note The **rsh** command can be used to put UXM running 9.2 into classic statistics mode. (Note that you need to have debug level privileges to access this command.) In addition, any UXM upgraded from 9.1 to 9.2 will no longer support classic statistics if a statistics level has been set on the card. The UXMe supports, at a minimum, Level 2 statistics, and since Level 2 statistics supports all the statistics needed for compatibility with 9.1 software.

Refer to Table 1-11 for a list of the multilevel channel statistics supported on the UXM.

Table 1-11 UXM with Multilevel Channel Statistics

Statistics Description	Level	OID Number	Stat Number	Interv	Sum
Cells Received from Port	1	0x05	0x2d	YES	YES
Cells Transmitted to Network	1	0x07	0x2f	YES	YES
Cells Received from Network	1	0x1f	0x30	YES	YES

Descriptions for Statistics Fields on cnfcdparm Screen

The field names on the **cnfcdparm** screen are similar to the field names on the **dspchstats** screen. Table 1-14 provides descriptions for fields that appear on the **cnfcdparm** screen. Note that the object names given may vary slightly from what actually appears on the **cnfcdparm** screen fields; similarly, the descriptions for each object (or screen field) correspond in most cases to the related object (or screen field) name, but not in all cases.

Table 1-14 Descriptions for cnfcdparm for BXM Card

Object ID	Object Name	Range/Values	Default	Description
01	Message Tag	Byte 0–3: Tag ID Byte 4–7: IP Address	0	Identifier and source IP address sent with ComBus message. Both will be copied into the response, if any is to be sent.
02	RESERVED			
03	LCN	1 – 64K	R	Identifies which channel to collect statistics.
04	RESERVED			
05	Rx Cells From Port	0 – 2 ³² -1	N/A	Number of cells received at the ingress of the connection. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
06	Rx EOFs From Port	0 – 2 ³² -1	N/A	Number of EOFs received at the ingress of the connection. [A:ALL, B:12, B:28]
07	Rx Cells to Backplane	0 – 2 ³² -1	N/A	Number of cells rx'd at the ingress that were sent to the backplane. [A:ALL, B:ALL]
08	Rx CLP=1 Cells From Port	0 – 2 ³² -1	N/A	Number of cells received at the port with CLP=1. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
09–0B	RESERVED			
0C	Rx EFCI=1 Cells From Port	0 – 2 ³² -1	N/A	Number of cells received at the port with EFCI=1. [A:28, B:28]
0D	RESERVED			
0E	Non-Compliant Cell Count (Total)	0 – 2 ³² -1	N/A	Number of cells received at the ingress of the connection that were non-compliant discarded. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware— it can wrap in less than a second depending upon non-compliant rate.)
0F	Non-Compliant Cell Count (CLP 0 Only)	0 – 2 ³² -1	N/A	Number of CLP 0 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware—it can wrap in less than a second depending upon non-compliant rate.)
10	Non-Compliant Cell Count (CLP 1 Only)	0 – 2 ³² -1	N/A	Number of CLP 1 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware— it can wrap in less than a second depending upon non-compliant rate.)

Table 1-14 Descriptions for cnfcdparm for BXM Card (Continued)

Object ID	Object Name	Range/Values	Default	Description
11	Ingress VC Q Depth	0 – 2 ³² -1	N/A	Current Ingress VC Queue Depth. [A:ALL, B:ALL]
12–14	RESERVED			
15	Rx Rsrc Ovfl Discards	0 – 2 ³² -1	N/A	Number of cells received at the port that were discarded due to Resource Overflow. [B:ALL]
16–1E	RESERVED			
1F	Tx Cells From Network	0 – 2 ³² -1	N/A	Number of cells received from the backplane. [A:ALL, B:ALL]
20	Tx CLP=1 To Port	0 – 2 ³² -1	N/A	Number of cells transmitted out the port with CLP=1. [A:ALL, B:12, B:28]
21	Tx EFCI=1 To Port	0 – 2 ³² -1	N/A	Number of cells transmitted out the port with EFCI=1. [A:12, A:28, B:12, B:28]
22	Tx Cells To Port	0 – 2 ³² -1	N/A	Number of cells transmitted out the port. [A:ALL, B:ALL]
23–26	RESERVED			
27	Loopback RTD Measurement	0 – 2 ³² -1	N/A	The Loopback Round Trip Delay measurement in msec. (Still under investigation.) Used to initiate the measurement (Set). The Get is used to get the last measurement known; or zero if now known.
28	Local Ingress Rx State	0: Okay 1: FERF (aka RDI) 2: AIS	0	The OAM connection state. [A:ALL, B:ALL]
29	Rx CLP=0 Congested Discards	0 – 2 ³² -1	N/A	Number of CLP=0 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]
2A	Rx CLP=1 Congested Discards	0 – 2 ³² -1	N/A	Number of CLP=1 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]
2B	Rx CLP=0 Cells From Port	0 – 2 ³² -1	N/A	Number of CLP=0 Cells received from the port. [A:ALL, B:ALL] (NOTE: This stat is received from the RCMP.)
2C	Tx CLP=0 Cells To Port	0 – 2 ³² -1	N/A	Number of CLP=0 Cells transmitted to the port. [A:ALL, B:12, B:28]
2D	Tx CLP=0 Cells From Backplane	0 – 2 ³² -1	N/A	Number of CLP=0 Cells received from the backplane. [A:ALL, B:28]
2E	Rx CLP=0 Cells To Backplane	0 – 2 ³² -1	N/A	Number of CLP=0 Cells sent to the backplane. [A:ALL, B:12, B:28]
2F	Tx CLP=1 Cells From Backplane	0 – 2 ³² -1	N/A	Number of CLP=1 Cells received from the backplane. [A:ALL, B:28]
30	Rx CLP=1 Cells To Backplane	0 – 2 ³² -1	N/A	Number of CLP=1 Cells sent to the backplane. [A:12, A:28, B:12,B:28]
31	Rx EFCI=0 Cells From Port	0 – 2 ³² -1	N/A	Number of EFCI=0 Cells received from the port. [A:28, B:28]

Table 1-14 Descriptions for cnfcdparm for BXM Card (Continued)

Object ID	Object Name	Range/Values	Default	Description
32	Tx EFCI=0 Cells To Port	0 – 2 ³² -1	N/A	Number of EFCI=0 Cells transmitted to the port. [A:12,A:28, B:12, B:28]
33	Tx EFCI=0 Cells From Backplane	0 – 2 ³² -1	N/A	Number of EFCI=0 Cells received from the backplane. [A:28, B:28]
34	Rx EFCI=0 Cells To Backplane	0 – 2 ³² -1	N/A	Number of EFCI=0 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
35	Tx EFCI=1 Cells From Backplane	0 – 2 ³² -1	N/A	Number of EFCI=1 Cells received from the backplane. [A:28, B:28]
36	Rx EFCI=1 Cells To Backplane	0 – 2 ³² -1	N/A	Number of EFCI=1 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
37	Tx EOFs to Port	0 – 2 ³² -1	N/A	Number of cells with EOF sent to the port. [A:12, A:28, B:28]
38	Tx EOFs from Backplane	0 – 2 ³² -1	N/A	Number of EOFs received at the backplane. [B:12, B:28]
39	Rx EOFs to Backplane	0 – 2 ³² -1	N/A	Number of cells with EOF sent to the backplane. [B:28]
3A	Rx Segment OAM	0 – 2 ³² -1	N/A	Number of Segment OAM cells received at the port. [A:28, B:28]
3B	Tx Segment OAM	0 – 2 ³² -1	N/A	Number of Segment OAM cells received at the egress. [A:28, B:28]
3C	Rx End-to-End OAM	0 – 2 ³² -1	N/A	Number of End-to-End OAM cells received at the port. [A:28, B:28]
3D	Tx End-to-End OAM	0 – 2 ³² -1	N/A	Number of End-to-End OAM cells received at the egress. [A:28, B:28]

Table 1-15 cnfcdparm Parameters

Parameter	Description
slot.port.vpi.vci	Specifies the slot, port, vpi, and vci on BXM card.

cnfcdpparm (Configure CVM Card Parameters)

The **cnfcdpparm** command configures parameters for the CVM.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfchts, **dchst**, **cnfecparm**

Syntax

cnfcdpparm <parameter number> <new value>

<parameter number> Specifies the number of the parameter to change. (See Table .)

<new value> Specifies the new value for the parameter.

Function

The **cnfcdpparm** command lets you configure CVM parameters for Modem Detection (MDM), certain reserved debug parameters, and In Frame and Out of Frame (I Frm and O Frm) thresholds for DS0A-type T1 applications. (See the **cnfln** description for information on assigning % Fast Modem on a per-channel basis.) Figure 1-7 lists the **cnfcdpparm** parameters. All CVMs in the node are dynamically reconfigured according to the new parameters. When you enter the command, the system prompts for a parameter number, as Figure 1-7 illustrates.

Caution You should consult the Cisco TAC before changing any of these parameter.

Figure 1-7 cnfcdpparm Parameters

```

```

This Command: cnfcdpparm

Which parameter do you wish to change:

Table 1-16 cnfcdpparm Parameters and Descriptions

No.	Parameter	Description	Default ¹
1	MDM Low Power Threshold	Power level for Modem Detect high-range threshold.	3160 (H)
2	MDM Stationary Coefficient	Indicates how rapidly the power level is changing to not be detected as modem.	14 (H)
3	MDM ZCR High Freq Threshold	Defines upper frequency value for 2100 Hz tone used in V.25 modem detection.	5A (H)
4	MDM ZCR Low Freq Threshold	Defines lower frequency value for 2100 Hz tone used in V.25 modem detection.	56 (H)
5	MDM Detect Failure Count	Defines number of failures above which fast modem is not declared.	4 (H)
6	MDM Detect Window Min.	Number of 5.25-milliseconds windows used in modem tests.	39 (H)
7	MDM Detect Silence Max.	Amount of time a channel stays in a modem-detected state. The parameter equals the value you enter times 84 milliseconds. Default=1008 milliseconds.	C (H)
8	MDM Pkt Header	Changes packet type from voice to non-timestamped for modems.	6 (D)
9	Null Timing Pkt Header	Gives a higher priority to the specified number of voice packets to decrease delay for spurts of talking.	4 (D)
10	Debug Parameter A	A reserved engineering debug parameter. This parameter does not actually go to the card.	0 (H)
11	Debug Parameter B	A reserved engineering debug parameter. This parameter does not actually go to the card.	0 (H)
12	I Frm 2.4 Threshold(msecs)	Specifies In Frame threshold for DS0 2.4 Kbps overhead data channel.	500 (D)
13	O Frm 2.4 Threshold (msecs)	Specifies Out of Frame threshold for DS0 2.4 Kbps overhead data channel.	500 (D)
14	I Frm 4.8 Threshold (msecs)	Same as 19 for DS0 4.8 Kbps channel.	500 (D)
15	O Frm 4.8 Threshold(msecs)	Same as 20 for DS0 4.8 Kbps channel.	500 (D)
16	I Frm 9.6 Threshold(msecs)	Same as 19 for DS0 9.6 Kbps channel.	500 (D)
17	O Frm 9.6 Threshold (msecs)	Same as 20 for DS0 9.6 Kbps channel.	500 (D)

¹ Enter value in either decimal (D) or hexadecimal (H).

cnfcftst (Configure Communication Fail Test Pattern)

The **cnfcftst** command changes the test pattern for communication failure testing.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dspcfctst

Syntax

cnfcftst

Function

The communication fail test pattern is used to periodically test for failure of nodes to communicate with each other. This test pattern is also used to recover from communication fail conditions. A communication fail is defined as a loss of controller communication over one or more trunks to a particular node. A communication fail differs from a communication break condition in that the node may be reachable over other paths. The communication fail test is used to test the failed trunk for proper controller traffic.

This command allows the user to configure the communication fail test pattern byte-by-byte. It defaults to a pattern of 4 bytes of 1s followed by 4 bytes of 0s. Varying the length of the test pattern makes the communications test more or less rigorous. Changing the characters determines the pattern sensitivity for strings of less than 14 bytes.

The **dspcfctst** command displays the current communication test pattern. The parameters used for declaring and clearing communication fails are set by the **cnfnodparm** command. Figure 1-8 illustrates a typical screen.

Figure 1-8 cnfcftst—Configure Communication Fail Test Pattern

Enter Byte 0:
```

cnfchstats (Configure Channel Statistics Collection)

Use the **cnfchstats** command to enable statistics collection for various channel parameters. The **cnfchstats** command is sometimes referred to as an “interval statistics” command—the statistics information collected is propagated to Cisco WAN Manager.

In Release 9.2, the Multilevel Channel Statistics feature provides additional levels of statistics (levels 2 and 3) beyond level 1 statistics. To configure the channel statistics level on the BXM and UXM card, use the **cnfdparm** command. This command lets you configure a specific card slot to support additional levels of statistics (levels 2 and 3) that were supported in releases previous to Release 9.2 (level 1). See the **cnfdparm** command for more information.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: BPX, IGX

Associated Commands

dspchstatcnf, **cnfdparm**, **dspchstathist**, **cnfchanstats**

Syntax

```
cnfchstats <channel> <stat> <interval> <e | d> [<samples> <size> <peaks>] [<nodename>]
```

<channel>	Specifies the channel (connection) to configure.
<stat>	Specifies the type of statistic to enable/disable. (See Table .)
<interval>	Specifies the time interval of each sample (1–255 minutes).
<eld>	Enables/disables a statistic. ‘E’ to enable; ‘D’ to disable a statistic.
[samples]	Specifies the number of sample to collect (1–255).
[size]	Specifies the number of bytes per data sample (1, 2 or 4).
[peaks]	Enables/disables the collection of one minute peaks. ‘Y’ to enable; ‘N’ to disable.
[nodename]	Specifies the name of the node to which the Cisco WAN Manager terminal connects.

Function

This debug command enables statistics collecting for channel parameters. Table 1-34 lists the statistics by type. Not all statistic types are available for all connections. Only valid statistics are displayed for you to select; inapplicable statistics appear in gray. If you are unsure of the size parameter to specify, select four bytes per sample.

The **dspchstatcnf** command displays the channel statistics configuration. Statistics are collected by and displayed on the Cisco WAN Manager workstation. Cisco WAN Manager allows statistics collection to be customized. You can disable a Cisco WAN Manager-enabled channel statistic by specifying the optional node name of the workstation as the last parameter on the command line. Figure 1-9 illustrates the parameters available for a typical connection.

Syntax

cnfchts <channel(s)> <pre-age>

<channel(s)> Specifies the data channel.

<pre-age> Specifies a value in 250-microsecond increments to go in the age field in the header of a time-stamped.

Function

This command configures the pre-age parameter for data channels. The pre-age parameter specifies the initial age of a time-stamped packet. With a non-zero pre-age, the packet has less time to wait at the destination before it reaches the Max Time Stamped Packet Age and is taken out of the ingress queue. (Data channels with the greater pre-age value are processed sooner.) However, if the pre-age value is too high because of queuing delays in the network, packets could be discarded because they appear too old at the destination.

The value you enter for Pre-Age should be a multiple of 250 microseconds (otherwise, the system rounds the value down to the nearest multiple of 250 microseconds). The default value is 0. Acceptable values are in the range 0 to the Max Time Stamped Packet Age (set by the **cnfsysparm** command). After you finish entering this command, the screen as in the example. After you change a timestamp, the connection should be rerouted or restarted for the new value to take effect.

Note You can see the value for Pre-Age in the screen display for the **dspchcnf** command. If **dspchcnf** is entered at a user-privilege level below super user level, the Pre-Age parameter does not appear in the **dspchcnf** output.

Example

```
pubsipx1      TN      SuperUser      IGX 8420      9.2      Aug. 14 1998 03:50 GMT

3.2-4      2      100      8      Enabled      0
```

Last Command: cnfchts 3.1 1000

Next Command:

cnfclnparm (Configure Circuit Line Parameter)

The **cnfclnparm** command configures the alarm integration time for circuit lines originating on a UVM, CDP or CVM and for T1/E1 Frame Relay circuits originating on an FRP, FRM, or UFM.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfclnsigparm, dchst

Syntax

cnfclnparm <line>

<line> Specifies the circuit line to configure.

Function

This command configures the circuit line alarm integration times for RED and YELLOW circuit line alarms. These integration times are specified in milliseconds and should be set to correspond to the local carrier's alarm integration times. Carrier integration times are typically 800 to 1500 ms. for RED Alarm and 1500 to 3000 ms. for YELLOW Alarm. The allowable range for these parameters are 60 to 3932100 ms. When you enter this command, the system responds with the screen shown in Figure 1-10.

Figure 1-10 cnfcln—Configure Circuit Line Alarm Integration Times

```

 2 Yel Alarm - In/Out [ 1000 / 2000] (Dec)
```

This Command: cnfclnparm 11

Which parameter do you wish to change:

cnfclnsigparm (Configure Circuit Line Signaling Parameters)

The **cnfclnsigparm** command configures signaling parameters for a UVM or CVM.

Note The CVM & UVM Heartbeat parameter (option 1) is the rate, in seconds, at which the card sends a signaling (ABCD bits) state update to the other end of the connection, even when there is no change in the state of the signaling bits. This is done because signaling packets are TS data packets, and there is a small chance that a signaling packet might be discarded somewhere in the network. This mechanism is a recovery mechanism to ensure that on-hook and off-hook notifications are not lost.

Increasing this interval will probably have no impact as long as none of the normal signaling TS data packets are being discarded in the network.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfclnparm, dspsig

Syntax

cnfclnsigparm <parameter number> <parameter value>

<parameter number> Specifies the parameter number of the signaling parameter to change.
(See Table .)

<parameter value> Specifies the new value to enter.

Function

The **cnfclnsigparm** command configures any of the UVM, CVM circuit line signaling parameters associated with the node. See Table 1-18 for the parameters and their values.

When you enter this command, the system responds with the display as shown in Figure 1-11.

Figure 1-11 cnfclnsigparm—Configure Circuit Line Signaling Parameters

```

Last Command: cnfclnsigparm

Which parameter do you wish to change:

Table 1-18 cnfclnsigparm Parameters and Descriptions

No.	Parameter	Description	Range
1	Heartbeat	<p>The current state of the signaling is periodically transmitted to the far end even if no signaling transitions are detected. This interval is determined by the value of "heartbeat."</p> <p>The CVM & UVM Heartbeat parameter (option 1) is the rate, in seconds, at which the card sends a signaling (ABCD bits) state update to the other end of the connection, even when there is no change in the state of the signaling bits. This is done because signaling packets are TS data packets, and there is a small chance that a signaling packet might be discarded somewhere in the network. This mechanism is a recovery mechanism to ensure that on-hook and off-hook notifications are not lost.</p> <p>Increasing this interval will probably have no impact as long as none of the normal signaling TS data packets are being discarded in the network.</p>	2–30 sec.
2	Signal Polling Rate	How often the control card polls the UVM/CVM for the status of the signaling. This parameter is used to update displays and statistics.	2–60 sec.
3	Default Inband Signal Delay	The transmit buffer timer value set after a valid signaling transition for in-band signaling arrives. After timeout, a signaling packet is sent.	30–96 msec.
4	Default Inband Playout Delay	The receive buffer timer that "ages" an incoming, time-stamped packet. When the age of the packet reaches the timestamp value, it moves on to depacketization and then to the user-equipment. This parameter is used to even out the delay between signaling packets and voice packets.	0–200 msec.
5	Default Pulse Signal Delay	Same as number 3 but applied to pulse signaling.	30–96 msec.
6	Default Pulse Playout Delay	Same as number 4 but applied to pulse signaling.	100–200 msec.

Table 1-18 cnfclnsigparm Parameters and Descriptions (Continued)

No.	Parameter	Description	Range
8	Packet Rate	Reserves trunk bandwidth for carrying UVM/CVM signaling.	0–1000 packets/sec.
9	Condition CCS Lines	If you specify “yes” for this parameter, the card applies signaling conditioning during an alarm to all channels on E1 CCS circuit lines to notify marked for Common Channel signaling to notify PBX of a line failure.	YES or NO
10	Inband Min. Wink	Same as 6 for in-band signaling.	120–300 msec.
11	Pulse Min. Wink	For UVM/CVM connections only, this parameter controls both wink and inter-digit intervals for signaling that arrives over the NPC or NPM signaling channel from a far end UVM/CVM.	120–300 msec.
12	Condition T1 Lines?	If you specify “yes” for this parameter, the card applies signaling conditioning during an alarm to all channels on T1 circuit lines to notify PBX of a line failure.	YES or NO

cnfcmparm (Configure Connection Management Parameters)

The **cnfcmparm** command configures various connection management parameters for the node.

The **cnfcmparm** command is used to enable cost-based route selection and the use of delay as the trunk cost. By default, delay is enabled. This worst-case delay for each connection type is calculated from the configured voice and non-timestamped trunk queue depths. For delay sensitive connections on the IGX (voice and non-timestamped), the worst-case trunk delay can be used as the per trunk cost. For delay sensitive connections on the BPX (ATM CBR), end-to-end delay is not used as a routing constraint in AutoRoute.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dsprrst, cnftlparm

Syntax

cnfcmparm <parameter number> <value>

<parameter number> Specifies the number of the parameter to change. See Table 1-19

<value> Specifies the new parameter value to enter.

Function

This command configures parameters that affect Adaptive Voice, Rerouting, and Courtesy Up/Down. These parameters are used only at the local node. Table 1-19 lists the parameters, their descriptions, and their default values.

Table 1-19 Connection Management Parameters

No.	Parameter	Description	Range	Default
1	Normalization Interval	The time delay in minutes between attempts to disable VAD (that is, to "normalize") on groups of voice connections. It is in force once the network has been stable for a while (see parameter 4, "Setting Interval").	1–10 minutes	2
2	Max Number To Normalize	The maximum number of connections that may be normalized at each normalization interval (see parameter 1)	1–50 connections	5 connections
3	Normalization Logging	This boolean specifies whether changes in VAD status are recorded in the event log	y=yes n=no	No
4	Settling Interval	The length of time, in minutes, following a disturbance in the network (trunk failure, and so on.) before normalization attempts are allowed.	1–10 minutes	4 minutes
5	Minimum Open Space	The minimum trunk bandwidth required, in packets/second, before normalization attempts are allowed. This is in addition to the statistical reserve for the trunk. Increasing this parameter causes all connections in the network to reroute (although the parameter only governs the local node).	0–8000 packets per second (pps)	1000 pps

Table 1-19 Connection Management Parameters (Continued)

No.	Parameter	Description	Range	Default
6	Normalization Priority	Determines the order in which connections are considered for VAD removal. It may be Class of Service (CoS) or load. While CoS is a simple test, the load option is more complex. The load, in packets/second, over the last "Load Sample Period" (see parameter 7) for all eligible connections (with or without VAD) is sampled. Every "Normalization Interval" (see parameter 1), the IGX node takes the "Max Number To Normalize" (see parameter 2) connections with VAD applied and compares their utilization with those with VAD already disabled. Those with the greatest load will have VAD disabled, if necessary, at the expense of some that were already disabled, where VAD is now applied. In this way, the most heavily used connections are continually found and have VAD disabled.	COS or Load (c/l)	1 (Load)
7	Load Sample Period	The period during which voice activity is sampled for load determination if parameter 6 is set to Load.	1–10 minutes	4 minutes
8	Maximum Routing Bundle	For rerouting, the maximum number of connections allowed in a routing request. For derouting, the maximum number of connections chosen using the CoS-based criterion. The value of this parameter should be set to less than that of parameter 21. A larger value provides a faster rerouting/derouting time. A smaller value provides better load balancing.	1–250	90
9	Reroute Timer	The number of seconds since the last reroute to wait before attempting another reroute of the same connection. After a connection has been successfully routed, it does not get rerouted again (especially for a connection that has previously experienced a failure at its preferred route) until this amount of time has elapsed. The time delay permits the preferred route to stabilize its operational status before a working connection with a preferred route is returned to the preferred route. A zero timer means the request is re-attempted immediately.	0–900 seconds	0 seconds
10	Timer Reset on Line Fail	This boolean specifies that the reroute timer in parameter 9 can be ignored if the current route actually fails (instead of attempting a rerouting of working connections on non-preferred routes).	y=yes n=no	y
11	Max Down/Up Per Pass	The maximum number of connections allowed to be upped or downed per pass. A larger value provides a faster completion of state update notifications, at the expense of potentially flooding the network. A smaller value provides better control of network traffic, but at the expense of prolonged state update notifications.	0–255	50
12	Down/Up Timer	The amount of time to wait before the next pass of upping/downing connections. A larger value provides slower-paced state update notifications, thus allowing time for the node to process other requests. A smaller value provides faster-paced state update notifications.	1000–65535 msec	30000 msec
13	Maximum Route Errors per Cycle	The maximum number of failed rerouting attempts allowed for a connection. Once this threshold has been reached, the connection is removed from the reroute group (see parameters 25, 26 and 27) and placed in a block waiting for the next cycle. (See also parameters 14 & 15.) A larger value provides a more resilient rerouting attempt. A smaller value allows a faster declaration of rerouting failure.	0–65535 failures	BPX: 50 IGX: 200

Table 1-19 Connection Management Parameters (Continued)

No.	Parameter	Description	Range	Default
14	Maximum Time Between Routing Cycles	All connections that have waited for this amount of time are allowed to be returned into the reroute group. The expiration of this timer starts off another cycle of rerouting attempts. (See also parameters 13 and 15.) A larger value provides more time for the network topology to settle before re-attempting a connection reroute. A smaller value allows more frequent reroute attempts.	1–8 minutes	5 minutes
15	Maximum Routing Error Cycles	The maximum number of cycles of rerouting attempts. Once this threshold has been reached, the connection is declared failed. You must use the rrtcon command to reroute the failed connection. (See also parameters 13 and 14.) Alternatively, the failed connection is rerouted when the BCC becomes active (for example, due to card reset or switchcc). A larger value provides a more resilient rerouting attempt. A smaller value allows a faster declaration of rerouting failure.	0–255 cycles	BPX: 10 IGX: 1
16	Routing pause timer	The amount of time to wait before the next rerouting attempt. Do not wait when set to 0. A larger value provides a slower-paced rerouting attempt, taking advantage of possible network topology updates. A smaller value allows for a faster-paced rerouting attempt that does not depend on the changing network topology.	0–65535 msec	0
17	Max. messages sent per update	The maximum number of CMUPDATE messages that may be sent into the network without acknowledgement. This parameter permits the transmitting node to throttle the networking traffic to prevent jamming. A larger value allows the broadcasting to complete faster, at the risk of jamming the network. A smaller value slows down the broadcasting without flooding the network, but at the expense of more broadcasting iterations.	0–223 decimal	10
18	Send SVC urgent msg	IGX only. This parameter enables an IGX node to inform each via node to remove an SVC connection during deletion. When disabled, the via nodes are not immediately informed through an update message. This causes the trunk loading occupied by a deleted SVC to remain unavailable until the update message is received by the via node.	y=yes n=no	BPX: n IGX: y
19	Max SVC Retry	IGX only. The maximum number of failed routing attempts before the SVC connection is declared failed. If the routing attempt fails due to a reason other than being “blocked,” the connection is immediately declared failed. A blocked attempt means that the routing state machine on the via/slave node is already processing a route request, or is locked by some other state machines. A larger value provides a more resilient SVC rerouting attempt. A smaller value allows a faster declaration of rerouting failure.	0–30 decimal	0
20	Wait for TBL updates	After routing all connections based on CoS, wait roughly this amount of time before the routing of other connections in need of rerouting (for example, those failed connections due to lack of critical internal resources). This delay allows the topology to settle after the CoS-based rerouting phase. This wait period should typically be one or two seconds longer than the time specified by the Fast Interval parameter (default 5 seconds) of the cnftlparm command.	0–65000 decimal	70 (x100 msec)

Table 1-19 Connection Management Parameters (Continued)

No.	Parameter	Description	Range	Default
21	Max derouting bundle	<p>The maximum number of connections chosen, based on load, that can be derouted concurrently. The value of this parameter should be set to greater than that of parameter 8. The actual number of connections concurrently derouted can reach the sum of this parameter and of parameter 8.</p> <p>A larger value provides a faster rerouting/derouting time.</p> <p>A smaller value provides better load balancing.</p>	0–16000 decimal	500
22	Enable cost-based routing	<p>This boolean specifies whether the Cost-Based Routing algorithm should be used in preference to the Hop-Based Routing algorithm. Yes means enable cost-based routing.</p> <p>Cost-based routing allows the network operation to better tune the network utilization based on the least cost.</p> <p>Hop-based routing is a simpler algorithm that selects a path strictly based on the least number of hops.</p>	y=yes n=no	n
23	Enable route cache usage	<p>This boolean specifies whether the most recent successfully-used routes are to be placed in cache, in order to avoid performing route selection. Yes enables route cache usage. The cache route can be either a cost-based route or a hop-based route.</p>	y=yes n=no	n
24	Use delay for routing	<p>This boolean specifies whether queuing delay is considered in the Cost-Based Routing algorithm. Yes means use delay for routing. The parameter is particular useful for time sensitive or voice connections.</p>	y=yes n=no	n
25	# of reroute groups used	<p>Specifies the number of reroute groups allowed for the node. Each reroute group is categorized based on the load requirement for each connection. The node reroutes connections with the highest load units first and proceeds with successively decreasing load unit ranges.</p> <p>A larger value provides more groups at the cost of more iterations stepping through the reroute groups during rerouting.</p> <p>A smaller value provides a faster completion of the iterations.</p>	1–200 groups	50
26	Starting size of RR groups	<p>The first reroute group is defined to consist of connections with load units at or below this parameter value. During rerouting, connections from this reroute group are considered last. Connections with load units above this value but at or below the sum of this value and that of the next parameter (Increment between RR groups) are placed in the second reroute group.</p> <p>A larger value provides a bigger range of bandwidth for the first reroute groups.</p> <p>A smaller value provides a more refined range of bandwidth included in the first reroute group.</p>	0–96000 cell load units (CLUs)	0 CLUs
27	Increment between RR groups	<p>Each of the remaining reroute groups is defined to consist of connections with load units higher than the previous reroute group, but at or below the sum of the previous reroute group threshold and this parameter value. The last reroute group can accommodate any load units above the second-last reroute group threshold.</p> <p>(See parameter 26 for a definition of the first reroute group.)</p> <p>A larger value provides a bigger range of bandwidth for each of a smaller number of reroute groups.</p> <p>A smaller value provides a smaller range of bandwidth for each of a larger number of reroute groups.</p>	1–96000 cell load units (CLUs)	100 CLUs

cnfdiagparm (Configure Diagnostic Test Parameters)

The **cnfdiagparm** command sets various diagnostic test parameters for the nodes.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnftstparm

Syntax

cnfdiagparm

Function

This command sets several parameters that affect the three IGX/BPX automatic diagnostic tests. Use this command to set test parameters on the internal system clock. Table 1-20 lists the parameters, descriptions, and default values for the **cnfdiagparm** command.

Table 1-20 Diagnostic Parameters

No.	Parameter *	Description	Default *
1	VDP Test Frequency (NOTE: This parameter is OBSOLETE.)	Interval between VDP background tests (in seconds).	50
2	LDP tstport delay	Seconds delayed before test data is sent.	10
3	System clock drift (8.192 Mhz)	Range of allowable drift of system clock.	±480
4	UEC-B's PLL railing (8.192 Mhz) (NOTE: This parameter is OBSOLETE.)	Range of UEC-B's phase lock loop rail.	±2720
5	NPC/NPM PLL Min. (8.192 Mhz)	Lower limit of controller card's PLL.	- 92000
6	NPC/NPM PLL Max. (8.192 Mhz)	Upper limit of controller card's PLL.	+ 508000
7	Clock Test Window	Number of samples that make up a window.	10
8	Clock Test Max Error in Window	Errors within window before fault isolation.	4
9	Clock Test Isolation Window	Window size during fault isolation.	10
10	Clock Fault Max. Error in Window	Errors allowed during fault isolation.	3
11	Clock Test Frequency	Interval between clock tests.	200 ms.
12	Clock Test Switch Delay	Delay clock testing after any clock transfers to allow settling.	3000 ms.
13	Card Reset Threshold		255
14	Card Reset Increment		0

* Clock Test parameters—Frequencies are in Hz, offset from 8.192 MHz

When you enter this command, the system responds with the screen illustrated in Figure 1-13. Note that parameters 1 and 4 are obsolete.

cnfdlparm (Configure Download Parameters)

The **cnfdlparm** command sets various software and firmware downloader parameters.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dspdnl

Syntax

cnfdlparm

Function

This command sets parameters that affect the SW/FW download protocol. It is primarily a debug command. It is included only to accommodate the possibility that some future software or firmware revision may need to be adjusted for optimizing the downloading process. See Table for descriptions of the downloading parameters.

Caution You should not change downloader parameters except under specific direction from the Technical Assistance Center (TAC).

Parameters

When you enter **cnfdlparm**, the system displays an indexed list of parameters. Table 1-21 describes these parameters, and Figure 1-14 illustrates the **cnfdlparm** screen.

Table 1-21 Configurable Download Parameters

No.	Parameter	Description	Range	Default
1	Rmt Blk Freq	For downloads to a remote node, <i>Rmt Blk Freq</i> is the time between blocks.	1–9999999 msecs	100 msecs
2	Rmt Blk Size	For downloads to a remote node, <i>Rmt Blk Size</i> is the number of bytes in each block.	1–7C0 hex	400 hex
3	Lcl Blk Freq	For downloads to the other processor in the same (local) node, <i>Lcl Blk Freq</i> is the time (in msecs) between blocks.	1–9999999 msecs	100 msecs
4	Lcl Blk Size	For downloads to the other processor in the same (local) node, <i>Lcl Blk Size</i> is the number of bytes in each block.	1–7C0 hex	400 hex
5	Image Req Freq	The time between requests for a description of an image. When a node seeks a new software image from other nodes, it first sends requests for a full <i>description</i> of the image residing on a node to determine if that node has the correct image. The requesting node sends its request one node at a time. <i>Image Req Freq</i> is the time between the last request and the request to another node. (This parameter is not a frequency but rather a time period.)	1–9999999 msecs	10000 msecs

Table 1-21 Configurable Download Parameters (Continued)

6	Dnld Req Freq	After a node seeking a new software image has found a node with the correct image, it requests a download of the image. If the node with the correct image is not available to send the image, the requesting node waits a period of time before it again requests the image. <i>Dnld Req Freq</i> is the period of time the requesting node waits before it again requests the image. (This parameter is not a frequency but rather a time period.)	1-9999999 msecs	10000 msecs
7	Session Timeout	The time a receiving node waits for a block transfer to resume. If a block transfer stops after downloading begins, the <i>Session Timeout</i> is the time the receiving node waits to resume before it gives up and requests the download again.	1-9999999 msecs	30000 msecs
8	Request Hop Limit	Limit on the number of hops the local node can go to request a download. (The number of hops is the number of trunks that are crossed for one node to communicate with another node.) <i>Request Hop Limit=1</i> means the request can go to only an immediate neighbor.	1-9999999	1
9	Crc Throttle Freq	The number of CRC calculations per second. <i>Crc Throttle Freq</i> lets you reduce the number of calculations so the node does not use processor time for CRC calculations.	1-9999999	5000
10	Crc Block Size	Number of bytes that a CRC calculation covers. The default is intentionally the same as <i>Rmt Blk Size</i> and <i>Lcl Blk Size</i> .	1-7C0 hex bytes	400 hex bytes
11	Rev Change Wait	The time to wait before the node actually loads the software for loadrev or runrev execution.	0-99999 msecs	0
12	CCs Switch Wait	A wait period before the node actually switches control cards during switchcc execution. During normal operation, you should have no reason to increase <i>CCs Switch Wait</i> .	1-9999999 msecs	1000 msecs
13	Lcl Response TO	On a local node, a processor that is downloading to another processor must receive an acknowledgment from the receiving processor for each block that correctly arrived. If the sending processor does not receive an acknowledgment by the time <i>Lcl Response TO</i> (Time Out) has elapsed, the downloading processor sends the block again.	1-9999999 msecs	5000
14	Rmt Response TO	When one node downloads to another node, the sending node must receive an acknowledgment for each block correctly received. If the sending node receives no acknowledgment by the time <i>Rmt Response TO</i> (Time Out) has elapsed, the sending node sends the block again.	1-9999999 msecs	30000
15	FW Dnld Block TO (Time Out)	The wait period that a controller card waits for an acknowledgment from a receiving card that it correctly received a block.	1-9999999 msecs	50 msecs
16	FW Dnld Msgs/Block	Number of Cbus messages per CRC block CRC check on the payload of the FW download msg	1-9999999 msecs	4
17	Flash Write TO	During flash memory programming, <i>Flash Write TO</i> (Time Out) is the time to wait for an acknowledgment that a write cycle finished before timing out.	1-9999999 msecs	16000 msecs
18	Flash Erase TO	During a flash memory erasure, <i>Flash Erase TO</i> (Time Out) is the time to wait for an acknowledgment that the erase cycle finished before timing out.	1-9999999 msecs	100

Table 1-21 Configurable Download Parameters (Continued)

19	Erase Verify TO	<i>Erase Verify TO</i> (Time Out) is the time to wait for an acknowledgment of the completion of the second (or “true”) verification of the erasure before timing out. The <i>Erase Verify TO</i> parameter is useful only if write/erase performance characteristics of a flash memory device change.	1–9999999 msecs	16000 msecs
20	Standby Flash TO	During flash memory programming, <i>Standby Flash TO</i> (Time Out) is the time to wait for an acknowledgment that the standby flash is available before timing out.	1–9999999 msecs	300 msecs
21	Lcl Flash Init TO	During flash memory programming, <i>Lcl (local) Flash Init TO</i> (Time Out) is the time to wait for an acknowledgment that a initialization of local flash memory finished before timing out.	1–9999999 msecs	1000
22	Flsh Write Blk Sz	Number of bytes per write cycle	1–10000 hex	10000 hex
23	Flsh Verify Blk Sz	Second (or “true”) verification of the block write. The <i>Flsh Verify Blk Sz</i> parameter is useful only if performance characteristics of a flash memory device change.	1–10000 hex	400 hex
24	Chips Per Write/Erase	Number of bytes per write/erase cycle	1, 2, or 4	1

When you enter this command the system responds with the screen illustrated in Figure 1-14.

This Command: cnfdlparm

Which parameter do you wish to change:

cnfecparm (Configure Echo Canceller Parameters)

The **cnfecparm** command configures the CDP or CVM integrated echo canceller (IEC) parameters for specified voice circuit line.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfchec, **dspecparm**

Syntax

cnfecparm <line> <parameter number> <parameter value>

- <line> Specifies the circuit line to configure.
- <parameter number> Specifies the number of the parameter to change. (See Table .)
- <parameter value> Specifies the new value to enter for the parameter.

Function

The **cnfecparm** command configures the UVM, CVM or CDP integrated echo canceller (IEC). It configures IEC parameters associated with all voice channels for the specified circuit line. Setting these parameters allows you to optimize the IEC performance. Table 1-22 lists the parameters you can modify. The **dspecparm** command description lists the defaults and provides a sample display. Also, refer to the **cnfchec** command in the *Cisco WAN Switching Command Reference* for configuring per-channel parameters.

Table 1-22 Echo Canceller Parameters

Index	Parameter	Description	Options
1	Echo Return Loss High	Maximum ERL required for echo canceller to converge on speech (value X 0.1 dB).	0–99 dB
2	Echo Return Loss Low	Minimum ERL required for echo canceller to converge on speech (value X 0.1 dB).	0–99 dB
3	Tone Disabler Type	Selection of protocol to enable tone disabler.	G.164, G.165
4	Non-Linear Processing	Selects type of post-canceller signal.	Center Clipper, Multiplying
5	NLP Threshold	Threshold below which non-linear processing is enabled (value X 0.1 dB).	0–99 dB
6	Noise Injection	Determines if noise will be injected when NLP is active.	Enable, Disable
7	Voice Template	Selection of template to use; normal voice levels or high voice levels.	USA—normal UK—high-level

When you enter this command the system responds with the screen illustrated in Figure 1-15.

Figure 1-15 cnfecparm—Configure Echo Canceller Parameters

7 CDP IEC Voice Template         [          USA]
```

This Command: cnfecparm 7

Which parameter do you wish to change:

cnffpcom (Configure FastPAD Communication Parameters)

The **cnffpcom** command configures the FastPAD communication parameters.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

None

Syntax

cnffpcom <slot.port> | <name> <trans timer> <alive timer> <retry count>

<slot.port>	Specifies the slot.port of the card that connects to the FastPAD.
<name>	Specifies the name of the FastPAD connected to the port.
<trans timer>	Specifies the transmission timer.
<alive timer>	Specifies the keep alive timer value.
<retry count>	Specifies the retry count value.

Function

This command configures the FastPAD communication parameters. When you enter this command, the system responds as shown in Figure 1-16.

Figure 1-16 cnffpcom—Configure FastPAD Communication Parameters

cnffpcon (Configure FastPAD Connection Parameters)

The **cnffpcon** command configures the FastPAD connection parameters.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

addcon, dspcon, dncon, upon

Syntax

cnffpcon <connection> [fr_bw]

<connection> Specifies the connection whose parameters to configure.

[fr_bw] Specifies the Frame Relay bandwidth parameters for the connection.

Function

This command configures connection parameters. When you enter this command, the system responds as shown in Figure 1-17.

Figure 1-17 cnffpcon—Configure FastPAD Connection Parameters

```

cnffpddelay (Configure FastPAD Delay)

The **cnffpddelay** command configures thresholds for severe congestion (Sc) and mild congestion (Mc) on the FastPAD.

Attributes

Jobs: No Log: Lock: Node Type: IGX

Associated Commands

none

Syntax

```
cnffpddelay <slot.port.subslot.subport><Sc><Mc>
```

<slot.port.subslot.subport> Specifies the FTC or FTM port and subport that connects to the FastPAD for configuring Sc and Mc.

<Sc> Severe congestion.

<Mc> Mild congestion.

Function

Use this command to set up the delay on the FTC port and subport to which the FastPAD is connected. See Figure 1-18 for a sample screen.

Figure 1-18 **cnffpddelay—Configure FastPAD Delay**

cnffpdpvc (Configure FastPAD PVC)

The **cnffpdpvc** command configures the FastPAD bc/bc PVC parameters.

Attributes

Jobs: No Log: Lock: Node Type: IGX

Associated Commands

none

Syntax

cnffpdpvc <slot.port.subslot.subport.dlci> <bc> <bc>

<slot.port.subslot.subport.dlci> Specifies the FTC or FTM port, subport, and DLCI of the FastPAD.

cnffpmap (Configure FastPAD Map Table)

The **cnffpmap** command configures the FastPAD map table.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cpyfpmap

Syntax

cnffpmap <slot.port>

<slot.port> Specifies the FTC or FTM port connected to the FastPAD.

Function

This command configures FastPAD map table. The map table contains the dialing plan for the FastPAD. When you enter this command, the system responds with the screen shown in Figure 1-19.

Figure 1-19 cnffpmap—Configure FastPAD Map Table

```

cnffstparm (Configure ForeSight Node Parameters)

The **cnffstparm** command configures the Optimized Bandwidth Management (formerly called ForeSight) parameters for Frame Relay ports.

Note As of Release 9.2, ForeSight is called Optimized Bandwidth Management.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnffrcon

Syntax

cnffstparm

No line or port number need be entered.

Function

This command configures the Optimized Bandwidth Management (formerly ForeSight) parameters for Frame Relay ports. This command only has an effect if the Frame Relay Optimized Bandwidth Management option is enabled. The parameter values set by this command apply to all Frame Relay connections enabled with Optimized Bandwidth Management. Therefore, these parameters must be configured on each node in the network that has Optimized Bandwidth Management connections. (The **cnffrcon** command enables Optimized Bandwidth Management on a connection.) Figure 1-22 illustrates BPX command menus. Table 1-23 lists the parameters of the **cnffstparm** command.

Figure 1-22 BPX System Response for cnffstparm

```

Next Command:

```

Table 1-23 cnffstparm Parameters

Number	Parameter	Description	Default
1	FRP Increase Rate	If free bandwidth is available, the rate at which FRP increases transmission (as a percentage of MIR).	10%
2	FRP Decrease Rate	If free bandwidth becomes unavailable, the rate at which FRP decreases transmission (as a percentage of current rate).	87%
3	FRP Fast Decrease Rate	If a cell is dropped or the TxQ is full, the rate at which FRP decreases transmission (as a percentage of current rate).	50%
4	RTD Measurement Time	The polling interval for measuring round-trip delay on each Frame Relay PVC.	5 sec.
5	Default RTD	The default RTD the connection uses before RTD is measured.	100 ms.
6	Minimum RTD	Min. value used for RTD in FR calculation regardless of measured RTD.	40 ms.
7	Maximum RTD	Max. value used for RTD in FR calculation regardless of measured RTD.	250 ms.
8	FECN for congested mins	When this percentage of packets received have the FECN bit set, a congested minutes field in the dsfrport command is indicated.	50%
9	QIR Time-out	Time before the allowable transmit rate is reset to QIR.	10 secs.
10	Max Test Delay Retries	Maximum number of delay test retries after a timeout.	2

cnflan (Configure LAN)

The **cnflan** command configures node communication parameters.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

upln, dnln, cnfln

Syntax

cnflan <IP_Address> <IP_Subnet_Mask> <Maximum LAN Transmit Unit> <TCP Service Port>

- | | |
|--------------------------|--|
| <IPAdd> | Specifies the Internet address of the node used in the TCP/IP protocol. |
| <IP subnet mask> | Specifies a 32-bit mask that contains information about the bit lengths of the subnet ID and host ID address fields. The format of this field uses 1s for the subnet ID field and 0s for the host ID address field as defined in the TCP/IP protocol. The default value (in decimal notation) is 255 255 255.0. This mask denotes both subnet ID and host ID fields as 8-bit fields. |
| <Max. LAN Transmit Unit> | BPX nodes only: typical length is 1500 bytes. |
| <TCPServicePort> | Specifies the node's service point used by the transmission control protocol (TCP). |
| <GatewayIPAddr> | Specifies the Internet gateway address. |

Function

This command configures node communication parameters, so the node can communicate with a Cisco WAN Manager terminal over an Ethernet LAN using TCP/IP protocol. The parameters all contain address information about the Ethernet TCP/IP network that connects the Cisco WAN Manager station to an IGX or BPX node. The values must conform to those of the network. The network administrator can supply the parameters. Refer to the screen in Figure 1-23.

Figure 1-23 cnflan—Configure LAN Parameters

```

cnflnparm (Configure ATM Line Card Parameters)

The **cnflnparm** command configures several parameters for ATM lines originating on the BPX or IGX nodes.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: BPX, IGX

Associated Commands

upln, dnln, cnfln

Syntax

cnflnparm <slot.port> <option 1-4>

<slot.port> Specifies the line to configure.

<option > Specifies the parameter to configure.

Function

This command configures the circuit line alarm integration times in milliseconds for Red and Yellow circuit line alarms. You should set them to correspond to the local carrier's alarm integration times. The **cnflnparm** range for each of these parameters is 60–3932100 ms. Carrier integration times are typically 800 ms–1500 ms for Red Alarm and 1500–3000 ms for Yellow Alarm.

You can also set the queue depth for the two queues associated with the ASI-0 card, the constant bit rate (CBR) queue and the Variable Bit Rate (VBR) queue. The queue depths may be increased to 16,000 bytes per queue.

When you enter **cnflnparm**, the system responds with the screen in Figure 1-24. The **cnflnparm** command is quite similar to the **cnfln** command.

Figure 1-24 cnflnparm—Configure ATM Line Card Parameters

LN 5.1 Parameters
  1 Red Alarm - In/Out [ 2500 / 15000] (Dec)
  2 Yel Alarm - In/Out [ 2500 / 15000] (Dec)
```

This Command: cnflnparm 5.1

Which parameter do you wish to change: Which parameter do you wish to change:

cnflnsigparm (Configure Line Signaling Parameters)

The **cnflnsigparm** command configures the line signaling parameters for the CVM and UVM voice cards.

Note The CVM & UVM Heartbeat parameter (option 1) is the rate, in seconds, at which the card sends a signaling (ABCD bits) state update to the other end of the connection, even when there is no change in the state of the signaling bits. This is done because signaling packets are TS data packets, and there is a small chance that a signaling packet might be discarded somewhere in the network. This mechanism is a recovery mechanism to ensure that on-hook and off-hook notifications are not lost.

Increasing this interval will probably have no impact as long as none of the normal signaling TS data packets are being discarded in the network.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnflnparm, cnflnstats, dsplnstatcnf, dsplnstathist, upln, dnln, cnfln

Syntax

cnflnsigparm <parameter number> <parameter value>

<parameter number> Specifies the number of the parameter to change.

<parameter value> Specifies the new value to enter.

Function

The **cnflnsigparm** command configures the line signaling parameters associated with a line. When you enter **cnflnsigparm**, the screen displays the parameters, as shown in Figure 1-25.

Note In Release 9.2, the CVM and UVM are supported cards. The CIP and CDP cards are not supported.

Figure 1-25 cnflnsigparm—Configure Line Signaling Parameters

2  CVM & UVM Sig. Polling Rate  [ 10] (sec)
3  CVM & UVM Default Inband Sig Delay [ 96] (msec)
4  CVM & UVM Default Inband Playout Delay [ 200] (msec)
5  CVM & UVM Default Pulse Sig Delay [ 96] (msec)
6  CVM & UVM Default Pulse Playout Delay [ 200] (msec)
7  UVM Number of Packet Slices [  1]
8  CVM & UVM Packet Rate       [ 200] (pkt/sec)
9  CVM & UVM Condition T1 CCS Lines or T1 Lines? [ YES]
10 UVM Default Inband Min. Wink [ 140] (msec)
11 UVM Default Pulse Min. Wink [ 140] (msec)
12 CVM & UVM Condition T1 Lines? [ YES] (yes/no)
    
```

This Command: cnflnsigparm

Which parameter do you wish to change

Table 1-24 describes the parameters of the **cnflnsigparm** command.

Table 1-24 cnflnsigparm Parameters and Descriptions

No.	Parameter	Description	Range
1	Heartbeat	The current state of the signaling is periodically transmitted to the far end even if no signaling transitions are detected. This interval is determined by the value of "heartbeat." The CVM & UVM Heartbeat parameter (option 1) is the rate, in seconds, at which the card sends a signaling (ABCD bits) state update to the other end of the connection, even when there is no change in the state of the signaling bits. This is done because signaling packets are TS data packets, and there is a small chance that a signaling packet might be discarded somewhere in the network. This mechanism is a recovery mechanism to ensure that on-hook and off-hook notifications are not lost. Increasing this interval will probably have no impact as long as none of the normal signaling TS data packets are being discarded in the network.	2–30 sec.
2	Signal Polling Rate	How often the control card polls the UVM/CVM for the status of the signaling. This parameter is used to update displays and statistics.	2–60 sec.
3	Default Inband Signal Delay	The transmit buffer timer value set after a valid signaling transition for in-band signaling arrives. After timeout, a signaling packet is sent.	30–96 msec.
4	Default Inband Playout Delay	The receive buffer timer that "ages" an incoming, time-stamped packet. When the age of the packet reaches the timestamp value, it moves on to depacketization and then to the user-equipment. This parameter is used to even out the delay between signaling packets and voice packets.	0–200 msec.
5	Default Pulse Signal Delay	Same as number 3 but applied to pulse signaling.	30–96 msec.
6	Default Pulse Playout Delay	Same as number 4 but applied to pulse signaling.	100–200 msec.

Table 1-24 cnflnsigparm Parameters and Descriptions (Continued)

No.	Parameter	Description	Range
7	CVM Number of Packet Slices		1
8	Packet Rate	Reserves trunk bandwidth for carrying UVM/CVM signaling.	0–1000 packets/sec.
9	Condition CCS Lines	If you specify “yes” for this parameter, the card applies signaling conditioning during an alarm to all channels on T1 circuit lines to notify PBX of a line failure.	YES or NO
10	Inband Min. Wink	Same as 6 for in-band signaling.	120–300 msec.
11	Pulse Min. Wink	For UVM/CVM connections only, this parameter controls both wink and inter-digit intervals for signaling that arrives over the NPC or NPM signaling channel from a far end UVM/CVM.	120–300 msec.
12	Condition T1 Lines?	If you specify “yes” for this parameter, the card applies signaling conditioning during an alarm to all channels on T1 circuit lines to notify PBX of a line failure.	YES or NO

cnflnstats (Configure Line Statistics Collection)

The **cnflnstats** command configures statistics collection for a line.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dsplnstatcnf, **dsplnstathist**

Syntax

cnflnstats <line> <stat> <interval> <e | d> [<samples> <size> <peaks>]

<line>	Specifies the port to configure.
<stat>	Specifies the type of statistic to enable/disable.
<interval>	Specifies the time interval of each sample (1–255 minutes).
<eld>	Enables/disables a statistic. 'E' to enable; 'D' to disable.
[samples]	Specifies the number of samples to collect (1–255).
[size]	Specifies the number of bytes per data sample (1, 2, or 4).
[peaks]	Enables the collection of one minute peaks. 'Y' to enable; 'N' to disable.

Function

Primarily, **cnflnstats** is a debug tool. It lets you customize statistics collected on each line. Table 1-25 lists the statistics for FastPacket-based cards with T1 or E1 lines. For other available parameters, refer to the actual screens on a node. For example, Figure 1-27 and Figure 1-28 show available statistics for a UXM port and an ASI-155 port, respectively.

Not all statistic types are available for all lines. Only valid statistics are displayed for you to select.

Table 1-25 Statistics for FastPacket Cards

Statistic Index Number	Statistic	Line Type
1	Bipolar Violations	E1 and T1
2	Frame Slips	E1 and T1
3	Out of Frames	E1 and T1
4	Loss of Signal	E1 and T1
5	Frame Bit Errors	E1 only
6	CRC Errors	E1 only
7	Out of Multi-Frames	E1 only

Table 1-25 Statistics for FastPacket Cards (Continued)

Statistic Index Number	Statistic	Line Type
8	All Ones in Timeslot 16	E1 only

Note Bipolar violations are not generally accumulated on E1 trunk and circuit lines. They are accumulated only on T1 lines connected to Frame Relay ports.

Figure 1-26 illustrates the screen displayed after entering **cnflnstats** on a FastPacket-based card. The three screens in Figure 1-27 show the statistics available on a UXM port. The two screens in Figure 1-28 show the statistics available on an ASI-155 card.

Functional Description

The following table provides a table of BXM “object names.” In many cases, the object name implies the screen field name on the **cnflnstats** screen.

provides a way for the software to fetch physical layer statistics from the Monarch firmware. Note: Where interface type is not specified it is implied to be of generic nature, and is good for all BXM interfaces (T3, E3, OC-3, OC-12).

Table 1-26 lists some line statistics descriptions for the BXM card. (Note that the object name given is in most cases the same as the screen field name, though they may vary slightly from the screen field name.)

Table 1-26 Line Statistics Descriptions for cnflnstats Command (BXM Card)

Object ID	Object Name	Range	Description
01	Message Tag	Byte 0-3: Tag ID Byte 4-7: IP Address	Identifier and source IP address sent with ComBus message. Both will be copied into the response, if any is to be sent.
02	Line Number	1 - 12	Identifies the target line number. If multiple line numbers are sent during the operation, then each line number object terminates the configuration for the string of objects for the previous line number.
03	Statistical Subset	Byte 0: Subset # 0: All stats 1-4: Subset # Byte 1-n: List of Stat Objects in subset	The set operator configures the subset template. The get operator uses the subset number to build a response. It ignores the "byte 1-n" string.
04	Statistics Auto-Reset Option	0: Disabled 1: Enabled	Statistics will be automatically reset after sent to the BCC in an Event Message if the Auto-Reset option is enabled. After the instance of an enable or disable command, the condition will persist until another Auto-Reset command is encountered. Note reset is on a line bases.
05	Total Cells Transmitted	0 - $2^{32}-1$	Total cells transmitted out the physical layer interface.
06	Total Cells Received	0 - $2^{32}-1$	Total cells received at the physical layer interface.
07	RESERVED		
08	LOS	0 - $2^{32}-1$	Number of instances of LOS.
09	LOF	0 - $2^{32}-1$	Number of instances of LOF.
0A	Line AIS	0 - $2^{32}-1$	Number of instances of AIS.
0B	Line RDI (YEL)	0 - $2^{32}-1$	Number of instances of Yellow Alarm detection.
0C	T3 / E3 LCV	0 - $2^{32}-1$	T3 / E3 Line Code Violation Count.
0D	T3 PCV	0 - $2^{32}-1$	T3 P-Bit Code Violations (Line) Count.
0E	T3 CCV	0 - $2^{32}-1$	T3 C-Bit Code Violations (Path) Count.
0F	T3 FEBE	0 - $2^{32}-1$	Far End Block Error.
10	T3 / E3 FERR	0 - $2^{32}-1$	Framing Errors Count.
11	T3 / E3 LES	0 - $2^{32}-1$	Line Errored Seconds Count. Incremented for each second there was at least one LCV.
12	T3 PES	0 - $2^{32}-1$	T3 P-Bit Errored Seconds Count. Incremented for each second there was at least one PES
13	T3 CES	0 - $2^{32}-1$	T3 C-Bit Errored Seconds Count. Incremented for each second there was at least one CES

Table 1-26 Line Statistics Descriptions for cnflnstats Command (BXM Card) (Continued)

Object ID	Object Name	Range	Description
14	T3 / E3 LSES	0 - 2 ³² -1	Line Severely Errored Seconds Count. Incremented for each second there were 44 or more LCVs
15	T3 PSES	0 - 2 ³² -1	T3 P-Bit Severely Errored Seconds Count. Incremented for each second there were 44 or more P-Bit Errors.
16	T3 CSES	0 - 2 ³² -1	T3 C-Bit Severely Errored Seconds Count. Incremented for each second there were 44 or more C-Bit Errors.
17	T3 / E3 SEFS	0 - 2 ³² -1	T3 / E3 Severely Errored Framing Seconds Count incremented for each second ether was one or more Severely Errored Framing Errors (OOF).
18	T3 / E3 UAS	0 - 2 ³² -1	Unavailable Seconds. Count starts from the onset of LOS, LOF, AIS.
19	T3 PLCP LOF	0 - 2 ³² -1	PLCP Loss of Frame. Number of times Loss of Frame detected by the PLCP
1A	T3 PLCP YEL	0 - 2 ³² -1	PLCP Yellow Alarm count.

cnfclnstats (Configure Circuit Line Statistics)

The **cnfclnstats** command configures parameters for circuit line statistics collection.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

dspchstats

Syntax

cnfclnstats <line> <stat> <interval> <eld> [**<samples>** **<size>** **<peaks>**]

- <line> Specifies the circuit line to configure.
- <stat> Specifies the type of statistic to enable/disable.
- <interval> Specifies the time interval of each sample (1–255 minutes).
- <eld> Enables/disables a statistic. 'E' to enable; 'D' to disable.
- [samples] Specifies the number of samples to collect (1–255).
- [size] Specifies the number of bytes per data sample (1, 2, or 4).
- [peaks] Enables/disables the collection of ten second peaks. 'Y' to enable; 'N' disable.

Function

This command configures circuit line statistics. The **cnfclnstats** command lets you customize statistics collection on each circuit line. It primarily applies to debugging and not standard network operation. Table 1-27 lists the **cnfclnstats** statistics by type. Figure 1-29 illustrates the display.

Not all statistic types are available for all lines. Valid statistics appear in full brightness while unavailable types appear in half brightness.

Table 1-27 cnfclnstats Command Statistics and Line Type

Statistic Type	Statistic	Line Type
1	Bipolar Violations	E1 and T1
2	Frame Slips	E1 and T1
3	Out of Frames	E1 and T1
4	Loss of Signal	E1 and T1
5	Frame Bit Errors	E1 only
6	CRC Errors	E1 only
7	Out of Multi-Frames	E1 only
8	All Ones in Timeslot 16	E1 only

Note Typically, bipolar violations do not accumulate on E1 trunks and circuit lines. They accumulate only on T1 lines and trunks.

Figure 1-29 illustrates the screens displayed after entering **cnfclnstats**. The card in the example is a UXM. The line is 5.1. The only statistic in this example is 215—the number of seconds that the path was unavailable. (To configure more statistics, you would have to re-enter the command.) Other parameters in this example are an interval of 5 minutes, an accumulation of 29 samples, a sample size of 2 bytes, and the choice of enabling of 10 minute peaks.

- 218) HCS Correctable Error

Last Command: cnfclnstats 5.1 215 5 e 29 2 y

Next Command:

cnfmxbutil (Configure Muxbus Utilization)

The **cnfmxbutil** command configures the Muxbus or Cellbus utilization factor for each FRP or FRM, respectively.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

none

Syntax

cnfmxbutil <slot number> <percentage>

<slot number> Specifies the slot number of the associated FRP card.

<percentage> Specifies the percent of Muxbus or cellbus bandwidth to allocate.

Function

The **cnfmxbutil** command lets you configure the Muxbus or cellbus utilization factor for each FRP or FRM in the node on a slot-by-slot basis. (System software automatically allocates a certain amount of bandwidth for each FRP or FRM in a node. Since the maximum data rate for an FRP or FRM is 2 Mbps, this bandwidth is also the maximum amount of the bus reserved for an FRP or FRM.)

In many applications, each of the four FRP or FRM ports is configured for a large number of 56 or 64 Kbps connections. System software totals the bandwidth required for all the connections, multiplies the total by 121% to reserve extra bandwidth for overhead, then subtracts this amount from the total available bus bandwidth.

However, statistically full utilization is not often required on ports with a large number of connections, so the reserved bus bandwidth may be further reduced. In a node with a T3 or E3 ATM trunk card, much of the bus bandwidth may be assigned to the ATM trunk, so you should exercise caution when allocating the remaining bus bandwidth.

See Figure 1-30 for a sample screen. The screen displays “N/A” for a slot where no FRP or FRM exists. Once the slot is selected, the system displays the message “Enter Utilization Factor.” The range is 1–250%. The default is 121%. The extra 21% for the default is for the overhead for encapsulating the Frame Relay frame into the FastPackets or ATM cells.

cnfnodeparm (Configure Node Parameter)

Sets a variety of general parameters for the nodes in a network.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

none

Syntax

cnfnodeparm

Function

The **cnfnodeparm** command lets you change some of the node's system parameters. The parameters you can set with **cnfnodeparm** are not closely related. Table 1-28 and Table 1-29 describe the parameters for the IGX and BPX nodes, respectively. After each table, an applicable set of **cnfnodeparm** screens appears. The defaults for the parameters are selected by Cisco engineering to operate under normal network conditions. With few exceptions, you should change them only with the guidance of the Cisco TAC.

In Release 9.2, two new options are provided that you can use to determine the maximum frequency with which hitless rebuilds can occur before a full rebuild of the node is started. See "Attributes" section on page 1-220 for more information on hitless rebuild.

Table 1-28 IGX cnfnodeparm Command Parameters

Index	Parameter	Description	Default
1	Update Initial Delay (sec.)	Specifies a factor for generating a delay before conditional updates are transmitted to the network after a controller card switch-over. The <i>Update Initial Delay</i> is multiplied by the number of nodes in the network.	5000 (D)
2	Update Per-Node Delay (ms.)	Specifies the delay between transmission of conditional updates to the nodes.	30000 (D)
3	Comm. Break Test Delay (ms.)	Normal interval between tests for communication break on any node.	30000 (D)
4	Comm. Break Test Offset	Factor between number of communication test failures and test successes to declare a node in communication break condition.	10 (D)
5	Network Timeout Period	Number of milliseconds to wait for a response to a communication test transmission before declaring a failure. The maximum is four failures.	1700 (D)
6	Network Inter-p Period	In inter-domain connections, <i>Network Inter-p Period</i> is the number of milliseconds to wait for a response to a communication test transmission before declaring a failure. The maximum is four failures.	4000 (D)
7	Network Sliding Window Size	Controls the number of control card messages that the node can simultaneously transmit to the network. This parameter defines the number of no acknowledgments outstanding on a controller before NACKS is declared.	1 (D)
8	Number of Normal Timeouts	For intra-domain connections: <i>Number of Normal Timeouts</i> is the maximum number of normal network retransmissions before the node signals a communication break.	7 (D)

* Enter value in either decimal (D) or hexadecimal (H).

cnfnodeparm (Configure Node Parameter)

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
9	Number of Inter-p Timeouts	For inter-domain connections: <i>Number of Inter-p Timeouts</i> is the maximum number of normal network retransmissions before the node signals a communication break.	3 (D)
10	Number of Satellite Timeouts	Maximum number of satellite network retransmissions before the node signals a communication break.	6 (D)
11	Number of Blind Timeouts	Maximum number of communication fail timeouts and retransmissions performed when using the blind channel. "Blind" refers to the message being sent across the trunk without knowing what node is on the other end of the trunk. The Comm Fail test uses this blind channel, however, the Comm Fail application has a non-configurable limit of three (3) comm failures before declaring Comm Fail. For example, the network handler task will attempt to deliver the Comm Fail request message four (4) times before reporting a failure back to the Comm Fail application, which will retry twice more (each with four retries on the blind channel) before declaring Comm Fail. The Number of Blind Timeouts parameter is the number of communication fail timeouts and retransmissions performed when using the blind channel.	4 (D)
12	Number of CB Msg Timeouts	Number of communication break timeouts and retransmissions before the node declares a communication break condition (CB). One successful acknowledgment clears the CB condition.	2 (D)
13	Comm. Fail Interval (ms.)	Minimum time allocated for communication fail testing of all trunks terminating on the local node.	10,000 (D)
14	Comm. Fail Multiplier	Number of Comm. Fail Intervals to skip for good lines.	3 (D)
15	Temperature Threshold (° C.)	Temperature in the enclosure that causes an over-temperature alarm to go to the controller card.	50 (D)
16	NPC Redundancy Configured	A "y" indicates a redundant controller card is required. The absence of a redundant controller card generates an alarm.	Y
17	MT3 Pass Through Delay	The parameter is OBSOLETE.	
18	Network Packet TX Rate	Rate for transmitting control card packets to the network. The range is a series of discreet values: 100 200 333 500 1000 1100 1200 1333 1500 2000. The units of measure are packets per second (pps). The purpose of this parameter is to prevent the control card from flooding the trunk with packets.	500 pps
19	TFTP Memory (x 10 KB)	Specifies the amount of controller memory to allocate for statistics collection.	76 (D)
20	Standby Update Timer	Specifies how often to send update messages to standby controller.	10 (D)
21	Stby Updts Per Pass	Number of messages that can be sent to standby NPC for each update interval.	30 (D)
22	Gateway ID Timer	An inter-domain rerouting timer. How often to look for junction nodes for new route.	30 (D)
23	GLCON Alloc Timer	Another inter-domain rerouting timer controlling gateway LCON function.	30 (D)
24	Comm Fail Delay	Number of seconds before starting to detect communication failures after a controller switch-over.	60 (D)
25	Nw Hdlr Timer (msec)	Network handler timer determines how long to wait to send messages to or receive messages from a remote node.	50 (D)
26	CBUS Delay	Specifies the minimum number of milliseconds the NPC or NPM must wait before it places the next command on the CBUS.	20 (D)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
27	SNMP Event Logging	Enables maintenance logging of global SNMP messages. These SNMP events are not errors but any GET, SET, and so on. Output goes to a printer connected to the node's auxiliary port or a terminal server (accessible via telnet). Without a connected output device, the parameter is meaningless.	y=yes
28	TFTP Grant Delay (sec)	The number of seconds the node waits before resending a TFTP request after a TFTP error has occurred. This field is display-only: you set the value in Cisco WAN Manager.	1
29	TFTTP ACK Timeout (sec)	The number of seconds the node waits for an acknowledgment of a TFTTP request before it declares the request as timed out. This field is display-only: you set the value in Cisco WAN Manager.	10
30	TFTP Write retries	The number of times the node retries a TFTP operation (not just writes) after a failed attempt. This field is display-only: you set the value in Cisco WAN Manager.	3
31	FRP/FRM Link Status Alarm	Determines whether a signaling failure on an FRP or FRM port causes a major alarm. This parameter applies to any port configured as an NNI.	y=yes
32	Job Lock Timeout	The range is 1–1000 seconds. The default of 0 disables this parameter.	0
33	Max Via LCONs	The maximum number of "via" connections a node can support. (A via connection does not terminate on the node but merely passes through.) This maximum is configurable, but you cannot lower the number below the current limit on the node. The default is the current maximum and should remain unchanged for normal operating conditions.	On an IGX node: 20000 On a BPX node: 50000
34	Max Blind Segment Size	The maximum size of each segment of a blind message. (The full message may be longer than the segment, especially in a large network.) A <i>blind message</i> is a message the local node sends to the far end node when you execute addtrk . If the trunk has many errors, smaller message segments increase the possibility of a successful addtrk . Under normal conditions, this parameter should remain the default.	3570
35	Max XmtMemBlks per NIB	Maximum number of memory blocks available for messages that are awaiting transmission. Under normal conditions, this parameter should remain the default.	3000
36	Max Mem stby update Q size	Maximum number of update messages that can reside in queues awaiting transmission to the standby processor. This percentage is used to determine when to flush the standby message queue when the percentage is reached. Only rare circumstances could provide a reason to change this parameter, so do not change it without first consulting the TAC.	5000
37	Trk Cell Rtnng Restrict	Specifies whether or not trunks on a UXM on an IGX node can route only cell traffic. The Trk Cell Rtnng Restrict parameter lets you specify a default for an option to the addcon command; that is, you can specify what the addcon parameter "Trunk cell routing restricted" prompts the user as a default, for example: "Trunk cell routing restricted? y/n [y]" or "Trunk cell routing restricted? y/n [n]." If "n" is specified, then fast-packet based routing is used. When adding or configuring ATM connections, this prompt will display for all connections (for example, CBR, ABR, UBR, and so on.) except for real-time VBR (rt-VBR) connections because rt-VBR connections should not be routed over FastPacket trunks.	Yes/No

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodparm Command Parameters (Continued)

Index	Parameter	Description	Default
38	Stat Config Proc Cnt	<p>Stat Config Proc Cnt is the number of statistics that will be enabled before pausing and allowing other processes to run. The default value of 1000 specifies that 1000 statistics should be enabled. But the count is only checked once for every object, so if the number of objects exceeds the count there will be one statistic enabled for each object.</p> <p>For example, if there are 1000 connections and the default count is set, one statistic will be enabled for each connection before pausing. If there are 2000 connections, one statistic will be enabled for each connection, then the number of statistics enabled (2000) will be compared to the count (1000). Since the number enabled exceeds the count, the enabling of statistics will pause.</p>	1000 (where count is between 1 and 100000)
39	Stat Config Proc Delay	<p>Specifies the amount of time in milliseconds (ms) that statistics processing pauses between enabling passes. On a heavily loaded switch, you may increase this number to reduce the load when enabling statistics, but the enabling process takes longer.</p> <p>The total (approximate) amount of time to process a statistics enable request is calculated as shown below:</p> $\text{total_time} = (\text{num_of_stats} / \text{count_per_pass}) * \text{delay_per_pass}$ <p>where num_of_stats is the sum of all statistics for this switch</p> $(\text{conns} * \text{conn stats} + \text{lines} * \text{line stats} + \dots)$ <p>count_per_pass is described above</p> <p>delay_per_pass is described above</p> <p>Using an example of a switch with 1000 connections (10 statistics per connection), three trunks (10 statistics per trunk), 10 ports (10 statistics per port), and the default settings (count = 1000, delay = 2000 msec) yields the following:</p> $\begin{aligned} \text{total_time} &= ((1000 * 10) + (3 * 10) + (10 * 10)) / 1000 * 2000 \\ &= (10130 / 1000) * 2000 \\ &= 11 * 2000 \\ &= 22000 \text{ msec} \\ &= 22 \text{ seconds} \end{aligned}$	2000 (where delay is between 50 and 60000 ms)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
40	Enable Degraded Mode	<p>Enables or disables the rebuild prevention feature on the node. Enabling this parameter causes a graceful switchover of the active controller card without having to do a rebuild. User connections and user traffic are maintained even when bugs or system overload would cause repeated aborts. Remaining updates are completed as fast as possible without affecting existing connections.</p> <p>If this parameter is disabled and an abort occurs during the update of the standby processor, the node rebuilds. Note that on the IGX, the active/standby/fail lights on the active card do not flash (as they do on the BPX node to indicate that the node is in degraded mode).</p> <p>If enabled, an abort condition will transition the node into degraded mode rather than rebuilding the node. You can disable this parameter (it is enabled by default) so that an abort will result in a rebuild. After degraded has been entered, a minimal set of functionality is available. (See the “High Priority Login” section for more information.) Disabled functions include provisioning and routing, network communications, event logging, and LAN access. However, connections continue to pass traffic. Once in degraded mode, a configurable parameter indicates whether to switch to the standby once it’s ready.</p> <p>If Enable Degraded Mode is enabled (Y), an abort condition will transition the node into degraded mode rather than rebuilding the node. You can disable this parameter so that an abort will result in a node rebuild.</p>	Y (enabled)
41	Enable Feeder Alert	<p>When degraded mode is entered, this parameter is set to yes, then a message is sent to the MGX 8220 interface shelves to update status of node so that connections will not fail. This parameter works in conjunction with degraded mode parameters (for example, Auto Switch on Degrade).</p> <p>If Enable Feeder Alert is disabled (the default) or, due to network congestion, the messages cannot be exchanged between the hub and the feeder to disable LMI, manual intervention can still be achieved by using the addfdrlp and delfdrp commands on the BPX. (Note that addfdrlp and delfdrp commands are service-level commands and can be used only by Cisco personnel.)</p>	[No is default] Yes/No
42	Trk Cell Rtnng Restrict	<p>Specifies whether connections can be routed using cell-based trunks only. The Trk Cell Rtnng Restrict parameter lets you specify a default for an option to the addcon command; that is, you can specify what the addcon parameter “Trunk cell routing restricted” prompts the user as a default, for example: “Trunk cell routing restricted? y/n [y]” or “Trunk cell routing restricted? y/n [n]”. If “n” is specified, then fast-packet based routing is used.</p>	Yes/No
43	Enable Reroute on Comm Fail	<p>Default value is FALSE. If there is communication failure, the node will not send the topology update message to the other nodes. If the value is set to TRUE, the node will send out a line change message and the remote nodes (master/slave) will deroute/condition the connections. You would sometimes use this parameter in conjunction with the Abit Notifications on LMI/ILMI Interface feature (which you enable with the cnfnodeparm SuperUser command). See the Abit Notifications feature description in the <i>Cisco WAN Switching Command Reference</i> for information on the Abit Notifications feature.</p>	[N] (Y/N)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodparm Command Parameters (Continued)

Index	Parameter	Description	Default
44	Auto Switch on Degrade	<p>When degraded mode is entered, the standby card is updated and ready. If the default is enabled (yes) then the card switchover happens automatically. If this parameter is set to yes, when degraded mode is entered, then the standby card is ready, and the card switchover happens automatically.</p> <p>After a node has entered degraded mode (see Enable Degraded Mode parameter), this parameter indicates whether to switch to the standby card once it is ready. The default setting is to enable switching. You can set this parameter to disable switching if you want to allow further time to diagnose the problem rather than switching to the other processor, or to stop switching due to repeated aborts.</p>	[Yes is default] Yes/No
45	Max Degraded Aborts	<p>Use this parameter to determine the maximum frequency with which degraded mode aborts can occur before some other action is taken. In other words, they will be used to threshold degraded mode aborts. Another action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>This parameter indicates the maximum number of aborts while in the degraded state. In the case where the processor continues to reset while in degraded mode, each reset will result in the processor staying in degraded mode unless this threshold has been reached, in which case the next reset will cause a full rebuild of the node. The desired result is to avoid infinite aborts while in degraded mode, which would essentially lock the node indefinitely.</p> <p>You can set Max Degraded Aborts to its maximum value (255) to indicate that the processor will be allowed to abort indefinitely without going through a full rebuild. This approach can be used to avoid a full rebuild (which will impact the user plane) until an appropriate time is reached when it may be reset or replaced.</p>	100 is default (range is 0–100 or 255 or infinite)
46	Max Hitless Rebuild Count	<p>Use this parameter to determine the maximum frequency with which hitless rebuilds can occur before some other action is taken. In other words, they will be used to threshold hitless rebuilds. Another action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>For example, using the default values of 100 for Max Hitless Rebuild Count and 1000 hours Hitless Counter Reset Time, a maximum of 100 hitless rebuilds can occur within a 1000 hour period before it is determined that degraded mode should be entered. For each hitless rebuild that occurs, if 1000 hours pass without the maximum hitless rebuild count having been exceeded, then that hitless rebuild will have aged beyond the point where it is still considered for thresholding purposes.</p> <p>If the maximum hitless rebuild count is set to “255” for “infinite,” then an unlimited number of hitless rebuilds can occur without the thresholding mechanism triggering a full rebuild or a change to degraded mode. In this case, the configurable hitless counter reset time will be ignored, no full rebuilds will be automatically performed. This allows you to determine when the best time is to manually perform a full rebuild, probably during a period of low traffic.</p> <p>At the other extreme, if the maximum hitless rebuild is set to zero, then no hitless rebuilds will be attempted. This disables the feature.</p> <p>When the configurable parameters Max Hitless Rebuild Count and Hitless Counter Reset Time are reconfigured, then the statistical counters for hitless rebuilds will be reset. The Max Hitless Rebuild Count and Hitless Counter Reset Time are new in Release 9.2, and will be stored in BRAM.</p>	100 (range is 0–100 or 255 or infinite)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
47	Hitless Counter Reset Time	<p>Use this parameter to determine the maximum frequency with which hitless rebuilds can occur before some other action is taken. In other words, they will be used to threshold hitless rebuilds. Another action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>For example, using the default values of 100 for Max Hitless Rebuild Count and 1000 hours Hitless Counter Reset Time, a maximum of 100 hitless rebuilds can occur within a 1000 hour period before it is determined that degraded mode should be entered. For each hitless rebuild that occurs, if 1000 hours pass without the maximum hitless rebuild count having been exceeded, then that hitless rebuild will have aged beyond the point where it is still considered for thresholding purposes.</p> <p>If the maximum hitless rebuild count is set to “255” for “infinite”, then an unlimited number of hitless rebuilds can occur without the thresholding mechanism triggering a full rebuild or a change to degraded mode. In this case, the configurable hitless counter reset time will be ignored, no full rebuilds will be automatically performed. This allows you to determine when the best time is to manually perform a full rebuild, probably during a period of low traffic.</p> <p>At the other extreme, if the maximum hitless rebuild is set to zero, then no hitless rebuilds will be attempted. This disables the feature.</p> <p>When the configurable parameters Max Hitless Rebuild Count and Hitless Counter Reset Time are reconfigured, then the statistical counters for hitless rebuilds will be reset. The Max Hitless Rebuild Count and Hitless Counter Reset Time are new in Release 9.2, and will be stored in BRAM.</p>	1000 hours (range is 1–1000)
48	Send Abit Early	<p>Specifies whether Abit is sent on deroute. The default is set to no initially. If you issue this command again, the prompt then shows the previously-provisioned value.</p> <p>Use the Send Abit Early parameter (option 48) to enable or disable the Abit Notifications feature. (The default is "N" which means the Abit Notifications feature is disabled.) If the Send Abit Early parameter is set to N, then the settings for parameter 49 (Abit Timer Multiplier M) and parameter 50 (Abit Timer Granularity N) are ignored and have no effect.</p> <p>After you enable the Send Abit Early parameter by setting it to yes, you can set the Abit Timer Granularity N and Abit Timer Multiplier M parameters.</p> <p>The Send Abit Early parameter works on conjunction with the Abit Timer Multiplier M and Abit Timer Granularity N parameters. You must set the Send Abit Early parameter to yes to enable it, then you can set the Abit Timer Multiplier M and Abit Timer Granularity N parameters.</p> <p>The different Abit behavior in Release 9.2 is completely local to the node and is applicable to the master and slave ends of connections when the connections are derouted. When only one of the nodes connected by a connection has the Send Abit Early enabled (set to “Y”), the timing in which that the Abit notification feature is sent at one end of the connection may be drastically different from the other end of the connection. Thus, it is recommended that the Send Abit Early parameter be configured the same on all nodes.</p> <p>For more information on the Send Abit Notification on ILMI/LMI using Configurable Timer feature, refer to the “Sending Abit Notification on ILMI/LMI Using Configurable Timer” section on page 3-7 in the <i>Cisco WAN Switching Command Reference, Release 9.2</i> manual.</p>	[N is default] (Y/N)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
49	Abit Timer Multiplier M	<p>The Abit Timer Multiplier M and Abit Timer Granularity N parameters are used in conjunction with the Send Abit Early parameter. You must set the Send Abit Early parameter to yes to enable it, then you can set Abit Timer Multiplier M and Abit Timer Granularity N parameters.</p> <p>You can set the Abit Timer Multiplier M option from 0 to 100. The default value is 0. When you execute the cnfnodeparm command, the prompt shows the previously-configured value, or the default value if no upgrade or no configuration on these values was done previously.</p> <p>A value "X" is the time to wait before Abit = 0 is sent out if the connection is in a derouted state. A connection derouted at a time period between 0 and N will send out Abit = 0 at a time between X and X + N, if the connection continues to be in a derouted state. In cases where there are many Abit status changes to report to the CPE, the last Abit updates may be delayed much longer because Abit updates process about 47 connections per second. To make a compromise between performance and the granularity of timers, Abit Timer Multiplier N can be configured to be from 3 to 255 seconds. The bigger the value of N, the better the system performance will be.</p> <p>The value of X is M * N (Abit Timer Multiplier M * Abit Timer Granularity N values). To compromise between performance and the granularity of timers, N can be configured to be from 3 to 255 seconds; the bigger the value of N, the better the system performance will be. The value of X (M * N) is set such that M can be configured to be from 0 to 100. The default value for N is 3 seconds. The default value for M is 0, meaning Abit = 0 sent out on deroute.</p> <p>It is recommended that the value of X (value of Abit Timer Multiplier M * value of Abit Timer Granularity N) be set such that when a trunk fails, the connections are given sufficient time to reroute successfully, avoiding the need to send out Abit = 0.</p> <p>If the value of X is set to be smaller than the normal time to reroute connections when a trunk fails, the time to complete rerouting them may take longer. This can happen for line cards and feeder trunks that have LMI/ILMI protocol runs on those cards, such as BXM on BPX and Frame Relay cards on IGX. Note that it takes time for those cards to process Abit status information for each connection coming from controller card through CommBus messages.</p> <p>To follow the general Release 9.2 interoperability, it is recommended that the Abit Notifications feature not be used when the standby control processor is in a locked state.</p>	<p>[Default is 0] (D)</p>

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-28 IGX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
50	Abit Timer Granularity N	<p>You can set the Abit Timer Granularity N option from 3 to 255 seconds. The default value is 3 seconds. You use the Abit Timer Granularity N and Abit Timer Multiplier M parameters in conjunction with the Send Abit Early parameter to configure the Early Abit Notifications on LMI/ILMI Interface using Configurable Timer feature in Release 9.2 and beyond. (The Send Abit Early parameter must be enabled before you can set the Abit Timer Multiplier M and Abit Timer Granularity N parameters.)</p> <p>The Early Abit Notifications feature lets the user specify the timer interval to wait before Abit = 0 is sent out if a connection fails to reroute and is in the derouted state too long. No precise timer is kept for each connection. Instead, all connections derouted during a certain time period go to the same bucket. This time period is "N", which defines the granularity of the timers, and is specified by the Abit Timer Granularity N parameter. Also, the value "X" is the time to wait before Abit = 0 is sent out if the connection is in a derouted state. A connection that is derouted at a time period between 0 and N will send out Abit = 0 at a time between X and X + N if the connection continues to be in a derouted state. In cases where there are many Abit status changes to report to the CPE, the last Abit updates may be delayed much longer because Abit updates process about 47 connections per second.</p> <p>To compromise between performance and the granularity of timers, you can configure the N value (Abit Timer Granularity N) to be from 3 to 255 seconds. The bigger the value of N, the better the system performance will be. The value of X should be M * N, where M can be configured to be from 0 to 100. The default value for N (specified by the Abit Timer Multiplier N parameter) is 3 seconds. The default value for M is 0, meaning that Abit = 0 is sent out on deroute. It is recommended that the value of X (Abit Timer Multiplier M value * Abit Timer Granularity N value) be set such that when a trunk fails, the connections are given sufficient time to reroute successfully, avoiding the need to send out Abit = 0.</p>	[Default is 3 seconds]

* Enter value in either decimal (D) or hexadecimal (H).

Figure 1-31 shows the available parameters on an IGX node.

This Command: cnfnodeparm

Enter parameter index:

Table 1-29 shows the available parameters on a BPX node for the **cnfnodeparm** command.

Table 1-29 BPX cnfnodeparm Command Parameters

Index	Parameter	Description	Default
1	Update Initial Delay (sec.)	This delay, multiplied times the number of nodes in the network, is the delay before conditional updates are transmitted to the network after a BCC switchover.	5000 seconds
2	Update Per-Node Delay (ms.)	Delay between transmission of conditional updates to nodes.	30000 msecs
3	Comm. Break Test Delay (ms.)	Interval between tests for communication breaks on any node.	3000 msecs
4	Comm. Break Test Offset	Factor between number of communication test failures and successful tests to declare a node in communication break condition.	10 (D)
5	Network Timeout Period	The time a node waits for a response to a communication test transmission before it declares a failure. Four failures allowed.	1700 (D)
6	Network Inter-p Period	The time a node waits for a response to a communication test transmission on inter-domain connections before it declares a failure. The maximum number failures is four.	4000 (D)
7	NW Sliding Window Size	Controls the number of BCC messages that can be transmitted simultaneously. Defines number of "no acknowledgments outstanding" on controller before NACKS declared.	1 (D)
8	Num. Normal Timeouts	Number of normal network retransmissions allowed before issuing a communication break condition (for intra-domain connections).	7 (D)
9	Num. Inter-p Timeouts	Number of normal network retransmissions allowed before issuing a communication break condition (for inter-domain connections).	3 (D)
10	Num. Satellite Timeouts	Number of satellite network retransmissions allowed before issuing a communication break.	6 (D)
11	Number of Blind Timeouts	Maximum number of communication fail timeouts and retransmissions performed when using the blind channel. "Blind" refers to the message being sent across the trunk without knowing what node is on the other end of the trunk. The Comm Fail test uses this blind channel.	4 (D)
12	Number of CB Msg Timeouts	Number of communication break timeouts and retransmissions before declaring a communication break (CB) condition. One successful acknowledgment clears CB.	2 (D)
13	Comm. Fail Interval (ms.)	Minimum time allocated for communication fail testing of all trunks terminating on the current node.	10,000 (D)
14	Comm. Fail Multiplier	Number of Comm. Fail Intervals to skip for good lines.	3 (D)
15	CC Redundancy Configured	Yes indicates a redundant controller card is required to prevent an alarm.	Y
16	Stats Memory (x 100 KB)	The amount of controller memory to allocate to statistics collection.	132 (D)
17	Standby Update Timer	Determines how often to send update messages to standby controller.	10 (D)
18	Stby Updts Per Pass	Number of messages that can be sent to standby NPC for each update interval.	50 (D)
19	Gateway ID Timer	An inter-domain rerouting timer. How often to look for junction nodes for new route.	30 (D)
20	GLCON Alloc Timer	Another inter-domain rerouting timer controlling gateway LCON function.	30 (D)
21	Comm Fail Delay	Number of seconds before starting to detect communication failures after a controller switchover.	60 (D)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
22	Nw. Hdlr Timer (msec)	Network handler timer determines how long to wait to send messages to or receive messages from a remote node.	50 (D)
23	SAR CC Transmit Rate	Transmit data rate for BCC traffic to standby BCC (Kbps).	560 (D)
24	SAR High Transmit Rate	Transmit data rate for BCC traffic to other BCC nodes (Kbps).	280 (D)
25	SAR Low Transmit Rate	Transmit data rate for BCC traffic to ICC nodes (Kbps).	56 (D)
26	SAR VRAM Cngestn Limit	The threshold for BCC traffic receive queue congestion that causes cell discards.	7680 (D)
27	SAR VRAM Cell Discard	BCC traffic receive queue discard amount in cells.	256 (D)
28	ASM Card Cnfged	Yes indicates an Alarm/Status Monitor card is required or an alarm will be generated.	Y
29	TFTP Grant Delay (sec)	The number of seconds the node waits before resending a TFTP request after a TFTP error has occurred. This field is display-only: you set the value in Cisco WAN Manager.	1
30	TFTP ACK Timeout (sec)	The number of seconds the node waits for an acknowledgment of a TFTP request before it declares the request as timed out. This field is display-only: you set the value in Cisco WAN Manager.	10
31	TFTP Write Retries	The number of times the node retries a TFTP operation (not just writes) after a failed attempt. This field is display-only: you set the value in Cisco WAN Manager.	3
32	SNMP Event logging	Enables maintenance logging of global SNMP messages. These SNMP events are not errors but any GET, SET, and so on. Output goes to a printer connected to the node's auxiliary port or a terminal server (accessible via telnet). Without a connected output device, the parameter is meaningless.	y=yes
33	Job Lock Timeout	The range is 1–1000 seconds. The default of 0 disables this parameter.	60
34	Max Via LCONs	The maximum number of “via” connections a via node can support. The default is the maximum for the node and should remain the default under normal operating conditions.	50000
35	Max Blind Segment Size	The maximum size of each segment of a blind message. (The full message may be longer than the segment, especially in a large network.) A <i>blind message</i> is a message the local node sends to the far end node when you execute addtrk . If the trunk has many errors, smaller message segments increase the possibility of a successful addtrk . Under normal conditions, this parameter should remain the default.	3570
36	Max XmtMemBlks per NIB	Maximum number of memory blocks available for messages that are awaiting transmission. Under normal conditions, this parameter should remain the default.	3000
37	Max Mem on Stby Q (%)	Maximum number of update messages that can reside in queues awaiting transmission to the standby processor. This percentage is used to determine when to flush the standby message queue when the percentage is reached. Only rare circumstances could provide a reason to change this parameter, so do not change it without first consulting the TAC.	5000

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
38	Stat Config Proc Cnt	<p>Stat Config Proc Cnt is the number of statistics that will be enabled before pausing and allowing other processes to run. The default value of 1000 specifies that 1000 statistics should be enabled. But the count is only checked once for every object, so if the number of objects exceeds the count there will be one statistic enabled for each object.</p> <p>For example, if there are 1000 connections and the default count is set, one statistic will be enabled for each connection before pausing. If there are 2000 connections, one statistic will be enabled for each connection, then the number of statistics enabled (2000) will be compared to the count (1000). Since the number enabled exceeds the count, the enabling of statistics will pause.</p>	1000 (where count is between 1 and 100000)
39	Stat Config Proc Delay	<p>Specifies the amount of time in milliseconds (ms) that statistics processing pauses between enabling passes. On a heavily loaded switch, you may increase this number to reduce the load when enabling statistics, but the enabling process takes longer.</p> <p>The total (approximate) amount of time to process a statistics enable request is calculated as shown below:</p> $\text{total_time} = (\text{num_of_stats} / \text{count_per_pass}) * \text{delay_per_pass}$ <p>where num_of_stats is the sum of all statistics for this switch (conns * conn stats + lines * line stats + ...)</p> <p>count_per_pass is described above</p> <p>delay_per_pass is described above</p> <p>Using an example of a switch with 1000 connections (10 statistics per connection), three trunks (10 statistics per trunk), 10 ports (10 statistics per port), and the default settings (count = 1000, delay = 2000 msec) yields the following:</p> $\begin{aligned} \text{total_time} &= ((1000 * 10) + (3 * 10) + (10 * 10)) / 1000 * 2000 \\ &= (10130 / 1000) * 2000 \\ &= 11 * 2000 \\ &= 22000 \text{ msec} \\ &= 22 \text{ seconds} \end{aligned}$	2000 (where delay is between 50 and 60000 ms)
40	Enable Degraded Mode	<p>Enables or disables the rebuild prevention feature on the node. Enabling this parameter causes a graceful switchover of the active controller card without having to do a rebuild. User connections and user traffic are maintained even when bugs or system overload would cause repeated aborts. Remaining updates are completed as fast as possible without affecting existing connections.</p> <p>If this parameter is disabled and an abort occurs during the update of the standby processor, the node rebuilds. On the BPX, the active/standby/fail lights on the active card flash at the same time indicating the node is in degraded mode.</p>	No (disabled)
41	Trk Cell Rtng Restrict	<p>Specifies whether connections can be routed using cell-based trunks only. The Trk Cell Rtng Restrict parameter lets you specify a default for an option to the addcon command; that is, you can specify what the addcon parameter “Trunk cell routing restricted” prompts the user as a default, for example: “Trunk cell routing restricted? y/n [y]” or “Trunk cell routing restricted? y/n [n]”. If “n” is specified, then fast-packet based routing is used.</p>	Yes/No

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
42	Enable Feeder Alert	<p>When degraded mode is entered, this parameter is set to yes, then a message is sent to the MGX 8220 interface shelves to update status of node so that connections will not fail. This parameter works in conjunction with degraded mode parameters (for example, Auto Switch on Degrade).</p> <p>If Enable Feeder Alert is disabled (the default) or, due to network congestion, the messages cannot be exchanged between the hub and the feeder to disable LMI, manual intervention can still be achieved by using the addfdrlp and delfdrp commands on the BPX. (Note that addfdrlp and delfdrp commands are service-level commands and can be used only by Cisco personnel.)</p>	[No is default] Yes/No
43	Reroute on Comm Failure	<p>Default value is False. If there is communication failure, the node will not send the topology update message to the other nodes. If the value is set to True, the node will send out a line change message and the remote nodes (master/slave) will deroute/condition the connections.</p> <p>You would sometimes use this parameter in conjunction with the Abit Notifications on LMI/ILMI Interface feature (which you enable with the cnfnodeparm SuperUser command). See the <i>Cisco WAN Switch Command Reference</i> for information on the Abit Notifications feature.</p>	True/False
44	Auto Switch on Degrade	<p>When degraded mode is entered, the standby card is updated and ready. If the default is enabled (yes) then the card switchover happens automatically. If this parameter is set to yes, when degraded mode is entered, then the standby card is ready, and the card switchover happens automatically.</p>	[Yes is default] Yes/No
45	Max Degraded Aborts	<p>Use this parameter to determine the maximum frequency with which degraded mode aborts can occur before some other action is taken. In other words, they will be used to threshold degraded mode aborts. Another action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>For example, using the default values of 100 for Max Hitless Rebuild Count, and 1000 hours Hitless Counter Reset Time, a maximum of 100 hitless rebuilds can occur within a 1000 hour period before it is determined that degraded mode should be entered. For each hitless rebuild that occurs, if 1000 hours pass without the maximum hitless rebuild count having been exceeded, then that hitless rebuild will have aged beyond the point where it is still considered for thresholding purposes.</p>	100 is default (range is 0–100 or 255 (infinite))

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodparm Command Parameters (Continued)

Index	Parameter	Description	Default
46	Max Hitless Rebuild Count	<p>Use this parameter to determine the maximum frequency with which hitless rebuilds can occur before some other action is taken. In other words, they will be used to threshold hitless rebuilds. Another action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>For example, using the default values of 100 for Max Hitless Rebuild Count, 1000 hours Hitless Counter Reset Time, a maximum of 100 hitless rebuilds can occur within a 1000 hour period before it is determined that degraded mode should be entered. For each hitless rebuild that occurs, if 1000 hours pass without the maximum hitless rebuild count having been exceeded, then that hitless rebuild will have aged beyond the point where it is still considered for thresholding purposes.</p> <p>If the maximum hitless rebuild counts is set to “255” for “infinite,” then an unlimited number of hitless rebuilds can occur without the thresholding mechanism triggering a full rebuild or a change to degraded mode. In this case, the configurable hitless counter reset time will be ignored, no full rebuilds will be automatically performed. This allows you to determine when the best time is to manually perform a full rebuild, probably during a period of low traffic.</p> <p>At the other extreme, if the maximum hitless rebuild is set to zero, then no hitless rebuilds will be attempted. This disables the feature.</p> <p>When the configurable parameters Max Hitless Rebuild Count and Hitless Counter Reset Time are reconfigured, then the statistical counters for hitless rebuilds will be reset. The Max Hitless Rebuild Count and Hitless Counter Reset Time are new in Release 9.2, and will be stored in BRAM.</p>	<p>100</p> <p>(range is 0–100 or 255 (infinite))</p>
47	Hitless Counter Reset Time	<p>Use this parameter to determine the maximum frequency with which hitless rebuilds may occur before some other action is taken. In other words, they will be used to threshold hitless rebuilds. Some other action could be a full rebuild, or it could be entering degraded mode. The allowable configurable range is shown in the Default column to the right.</p> <p>For example, using the default values of 100 for Max Hitless Rebuild Count, 1000 hours Hitless Counter Reset Time, a maximum of 100 hitless rebuilds may occur within a 1000 hour period before it is determined that degraded mode should be entered. For each hitless rebuild that occurs, if 1000 hours pass without the maximum hitless rebuild count having been exceeded, then that hitless rebuild will have aged beyond the point where it is still considered for thresholding purposes.</p>	<p>1000 hours</p> <p>(range is 1–1000)</p>

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodeparm Command Parameters (Continued)

Index	Parameter	Description	Default
48	Send Abit Early	<p>Specifies whether Abit is sent on deroute. The default is set to no initially. If you issue this command again, the prompt then shows the previously provisioned value.</p> <p>Use the Send Abit Early parameter (option 48) to enable or disable the Abit Notifications feature. (The default is “N” which means the Abit Notifications feature is disabled.) If the Send Abit Early parameter is set to N, then the settings for parameter 49 (Abit Timer Multiplier M) and parameter 50 (Abit Timer Granularity N) are ignored and have no effect.</p> <p>After you enable the Send Abit Early parameter by setting it to yes, you can set the Abit Timer Granularity N and Abit Timer Multiplier M parameters.</p> <p>The Send Abit Early parameter works in conjunction with the Abit Timer Multiplier M and Abit Timer Granularity N parameters. You must set the Send Abit Early parameter to yes to enable it, then you can set the Abit Timer Multiplier M and Abit Timer Granularity N parameters.</p> <p>Note that a preRelease 9.1.07 node or Release 9.1.07 node with the Release 9.1.07 cnfnodeparm Send Abit immediately parameter turned off behaves the same way as a Release 9.2 node with the Early Abit Notifications on ILMI/LMI Interface using Configurable Timer feature disabled. A 9.1.07 node with the cnfnodeparm Send Abit immediately parameter turned on behaves the same as a Release 9.2 node with the Send Abit Early (option 48 in cnfnodeparm) set to yes and the Abit Timer Multiplier M (option 49 in cnfnodeparm) set to 0.</p> <p>The different Abit behavior in Release 9.2 is completely local to the node and is applicable to the master and slave ends of connections when the connections are derouted. When only one of the nodes connected by a connection has the Send Abit Early enabled (set to “Y”), the timing in which that the Abit notification feature is sent at one end of the connection may be drastically different from the other end of the connection. Thus, it is recommended that the Send Abit Early parameter be configured the same on all nodes.</p> <p>For more information on the Send Abit Notification on ILMI/LMI using Configurable Timer feature, refer to “Sending Abit Notification on ILMI/LMI Using Configurable Timer” section on page 3-7 in the <i>Cisco WAN Switching Command Reference, Release 9.2</i> manual.</p>	[N is default] (Y/N)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodparm Command Parameters (Continued)

Index	Parameter	Description	Default
49	Abit Timer Multiplier M	<p>The Abit Timer Multiplier M and Abit Timer Granularity N parameters are used in conjunction with the Send Abit Early parameter. You must set the Send Abit Early parameter to yes to enable it, then you can set Abit Timer Multiplier M and Abit Timer Granularity N parameters.</p> <p>You can set the Abit Timer Multiplier M option from 0 to 100. The default value is 0. When you execute the cnfnodparm command, the prompt shows the previously configured value, or the default value if no upgrade or no configuration on these values was done previously.</p> <p>A value "X" is the time to wait before Abit = 0 is sent out if the connection is in a derouted state. A connection derouted at a time period between 0 and N will send out Abit = 0 at a time between X and X + N , if the connection continues to be in a derouted state. In cases where there are many Abit status changes to report to the CPE, the last Abit updates may be delayed much longer because Abit updates process about 47 connections per second. To make a compromise between performance and the granularity of timers, Abit Timer Multiplier N can be configured to be from 3 to 255 seconds. The bigger the value of N, the better the system performance will be.</p> <p>The value of X is M * N (Abit Timer Multiplier M * Abit Timer Granularity N values). To compromise between performance and the granularity of timers, N can be configured to be from 3 to 255 seconds; the bigger the value of N, the better the system performance will be. The value of X (M * N) is set such that M can be configured to be from 0 to 100. The default value for N is 3 seconds. The default value for M is 0, meaning Abit = 0 sent out on deroute.</p> <p>It is recommended that the value of X (value of Abit Timer Multiplier M * value of Abit Timer Granularity N) be set such that when a trunk fails, the connections are given sufficient time to reroute successfully, avoiding the need to send out Abit = 0.</p> <p>If the value of X is set to be smaller than the normal time to reroute connections when a trunk fails, the time to complete rerouting them may take longer. This can happen for line cards and feeder trunks that have LMI/ILMI protocol runs on those cards, such as BXM on BPX and Frame Relay cards on IGX. Note that it takes time for those cards to process Abit status information for each connection coming from controller card through CommBus messages.</p> <p>Note that a preRelease 9.1.07 node or a 9.1.07 node with the Send Abit Early parameter turned off behaves the same way as a Release 9.2 node with the Release 9.2 Early Abit Notifications feature disabled. A 9.1.07 node with the Send Abit Early parameter turned on behaves the same way as a Release 9.2 node with the Send Abit Early parameter set to on, and the Abit Timer Multiplier M parameter set to 0.</p> <p>To follow the general Release 9.2 interoperability, it is recommended that the Abit Notifications feature not be used when the standby control processor is in a locked state.</p>	[Default is 0] (D)

* Enter value in either decimal (D) or hexadecimal (H).

Table 1-29 BPX cnfnodparm Command Parameters (Continued)

Index	Parameter	Description	Default
50	Abit Timer Granularity N	<p>You can set the Abit Timer Granularity N option from 3 to 255 seconds. The default value is 3 seconds. You use the Abit Timer Granularity N and Abit Timer Multiplier M parameters in conjunction with the Send Abit Early parameter to configure the Early Abit Notifications on LMI/ILMI Interface using the Configurable Timer feature in Release 9.2 and beyond. (The Send Abit Early parameter must be enabled before you can set the Abit Timer Multiplier M and Abit Timer Granularity N parameters.)</p> <p>The Early Abit Notifications feature lets the user specify the timer interval to wait before Abit = 0 is sent out if a connection fails to reroute and is in the derouted state too long. No precise timer is kept for each connection. Instead, all connections derouted during a certain time period go to the same bucket. This time period is "N", which defines the granularity of the timers, and is specified by the Abit Timer Granularity N parameter. Also, the value "X" is the time to wait before Abit = 0 is sent out if the connection is in a derouted state. A connection that is derouted at a time period between 0 and N will send out Abit = 0 at a time between X and X + N if the connection continues to be in a derouted state. In cases where there are many Abit status changes to report to the CPE, the last Abit updates may be delayed much longer because Abit updates process about 47 connections per second.</p> <p>To compromise between performance and the granularity of timers, you can configure the N value (Abit Timer Granularity N) to be from 3 to 255 seconds. The bigger the value of N, the better the system performance will be. The value of X should be M * N, where M can be configured to be from 0 to 100. The default value for N (specified by the Abit Timer Multiplier N parameter) is 3 seconds. The default value for M is 0, meaning that Abit = 0 is sent out on deroute. It is recommended that the value of X (Abit Timer Multiplier M value * Abit Timer Granularity N value) be set such that when a trunk fails, the connections are given sufficient time to reroute successfully, avoiding the need to send out Abit = 0.</p>	[Default is 3 seconds]
51	FBTC with PPD Policing	<p>If you have installed a BXM card with the RCMP (Routing Control Monitoring and Policing) chip, which supports PPD on policing, you may enable this feature by setting this parameter to Y. Older BXM cards do not support PPD on policing.</p> <p>After enabling this parameter, a warning appears: "Warning: Must switchyred or reset PPDolic BXM line cards after change." Note that these operations are not supported in remote NMS stations.</p> <p>Next you must choose one of two options by entering either Y or N:</p> <p>Y - BXM FBTC on thresholds & PPD policing This option is supported only on BXM cards with the new version of the RCMP chip that provides this functionality.</p> <p>N - BXM FBTC on thresholds Provides FBTC on CLP thresholds only.</p> <p>Although it is not recommended to use both an older BXM card and a BXM card that supports PPD on policing on a y-redundant pair, you can do so. The severity of the feature mismatch is minor because FBTC can still function based on the CLP thresholds on the BXM card that does not support PPD on policing. This parameter is a one-time installation task; it should not be frequently changed.</p>	[N is default] (Y/N)

* Enter value in either decimal (D) or hexadecimal (H).

Note The following example illustrates the two screens required to show all **cnfnodeparm** parameters on a BPX node.

Last Command: cnfnodeparm 38 Y

Next Command:

Minor Alarm

cnfnwip (Configure Network IP Address)

The **cnfnwip** command configures an IP address and subnet mask for the node.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

none

Syntax

cnfnwip <IPAddr> <IPSubnetMask>

<IPAddr> IP address of the node: the format is *nnn.nnn.nnn.nnn*, where *nnn* can be 1–255

<IPSubnetMask> subnet mask: the format is *nnn.nnn.nnn.nnn*

An example of this command is:

```
cnfnwip 199.35.96.217 255.255.255.0
```

where 199.35.96.217 is the IP address, and 255.255.255.0 is the subnet mask.

Function

The network IP address and subnet mask support statistics collection for Cisco WAN Manager. The **cnfnwip** command defines the IP address the system uses to pass messages between Cisco WAN Manager and the node. The Statistics Master process in Cisco WAN Manager Network collects statistics. The Statistics Manager requests and receives statistics using TFTP Get and Put messages. These TFTP messages pass between the node and the Statistics Master using IP Relay. (See the **cnfstatmast** description for details on setting the Statistics Master address.) For an example of the **cnfnwip** command, refer to the screen in Figure 1-32.

Figure 1-32 cnfnwip—Configure Network IP Address

```

Active Network IP Address:      169.134.90.106  
Active Network IP Subnet Mask:  255.255.255.0
```

Last Command: cnfnwip 169.134.90.106 255.255.255.0

Next Command:

cnfphyslnstats (Configure Physical Line Statistics)

The **cnfphyslnstats** command configures parameters for circuit line statistics collection. This is a debug command that applies to physical lines on a UXM that is using Inverse Multiplexing Over ATM (IMA)—a *logical* trunk configuration.

In Release 9.2, for virtual trunking, physical line statistics apply to each physical port. In the case of IMA trunks, the physical line statistics are tallied separately for each T1 port.

IMA physical line alarms are a special case. Each IMA trunk port has a configurable number of retained links. If the number of non-alarmed lines is less than the number of retained links, the logical trunks on the IMA trunk port are placed into major alarm.

For example, consider there are IMA virtual trunks 4.5-8.2 and 4.5-8.7. Further, the number of retained links on 4.5-8 has been configured to 2. If 4.5 and 4.6 go into LOS (loss of signal), physical line alarms are generated for these two physical lines. The logical trunks 4.5-8.2 do not go into alarm because the two retained links are still healthy. In this situation, the bandwidth on the logical trunks is adjusted downward to prevent cell drops, and the connections on those trunks are rerouted. If a third line goes into alarm, the logical trunks are then failed.

The **cnfphyslnstats** command lets you configure the following additional physical line statistics (which support the ATM Forum compliant IMA protocol). A description of these statistics follows in Table 1-30.

Table 1-30 IMA Physical Line Statistics

Statistics
IMA Violations
Near End Severely Errored Seconds (SES-IMA)
Far End Severely Errored Seconds (SES-IMA-FE)
Near End Unavailable Seconds (UAS-IMA)
Far End Unavailable Seconds (UAS-IMA-FE)
Near End Tx Unusable Seconds (Tx-UUS-IMA)
Near End Rx Unusable Seconds (Rx-UUS-IMA)
Far End Tx Unusable Seconds (Rx-UUS-IMA-FE)
Far End Rx Unusable Seconds (Rx-UUS-IMA-FE)
Near End Tx No. of Failures (Tx-FC)
Near End Rx No. of Failures (Rx-FC)

Attributes

Jobs: YesLog: YesLock: YesNode Type: IGX

Associated Commands

dspphyslnstats, dspphyslnstathist

Syntax

cnfphyslnstats <port> <line> <stat> <interval> <eld> [<samples> <size> <peaks>]

- <port> Specifies the port with the physical line to configure.
- <line> Specifies the physical line to configure.
- <stat> Specifies the type of statistic to enable/disable.
- <interval> Specifies the time interval of each sample (1–255 minutes).
- <eld> enables/disables a statistic. 'E' to enable; 'D' to disable.
- [samples] Specifies the number of samples to collect (1–255).
- [size] Specifies the number of bytes per data sample (1, 2, or 4).
- [peaks] Enables/disables the collection of ten second peaks. 'Y' to enable; 'N' disable.

Function

This command configures physical line statistics on a UXM card. The **cnfphyslnstats** command lets you customize statistics collection on each physical line. It primarily applies to debugging and not standard network operation. To see the statistics available for each type of interface, refer to the actual screens for each interface, as in the subsequent illustrations. Figure 1-33, Figure 1-34, Figure 1-35, Figure 1-36, and Figure 1-37 show the available statistics for OC-3/STM1, T3, E3, T1, and E1, respectively.

Figure 1-33 cnfphyslnstats—Configure Physical Line Statistics (OC-3)

cnfportstats (Configure Port Statistics Collection)

The **cnfportstats** command configures parameters for ports.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

none

Syntax

cnfportstats <port> <stat> <interval> <eld> [<samples> <size> <peaks>]

<port>	Specifies the port to configure.
<stat>	Specifies the type of statistic to enable/disable.
<interval>	Specifies the time interval of each sample (1–255 minutes).
<eld>	Enables/disables a statistic. 'E' to enable; 'D' to disable.
[samples]	Specifies the number of samples to collect (1–255).
[size]	Specifies the number of bytes per data sample (1, 2 or 4).
[peaks]	Enables the collection of one minute peaks. 'Y' to enable; 'N' to disable.

Function

The **cnfportstats** command configures port statistics. The primary purpose of this command is debugging. Table 1-31 lists the configurable statistics for a Frame Relay port. For port statistics in general, refer to the actual **cnfportstats** screens on a node. Not all statistic types are applied to all ports. To see the statistics for Frame Relay, UXM, and ASI-155 ports, refer to Figure 1-38, Figure 1-39, and Figure 1-40, respectively.

In Figure 1-38, for example, the screen shows that the selected statistic is 33—the number of transmitted bytes while the ingress LMI is showing a failed condition. After the port number and statistic number (33) on the command line, the remaining parameters are the interval, enable for this statistic, number of samples, and so on.

Table 1-31 Configurable Statistics for a Frame Relay Port

Type	Statistic
1–4	Total frames and bytes transmitted and received.
5–6	Frames transmitted with FECN and BECN set.
7–10	Frames received with problems: CRC errors, invalid format, frame alignment errors, wrong length frames.

Table 1-31 Configurable Statistics for a Frame Relay Port (Continued)

Type	Statistic
11	Number of direct memory access (DMA) overruns on a Frame Relay port that are probably due to excessive user-data input.
12–17	LMI counts on UNI ports. These include status inquiries, status transmit and update requests, invalid inquiries, and LMI link timeouts.
18	Frames received with DLCIs in error.
19	Frames dropped with DE bit set.
20–24	LMI counts on NNI ports: status inquiries, status receive and update requests, LMI link timeouts, keepalive sequence errors.
25–26	Frame and byte count totals for Consolidated Link Layer Message (CLLM) frames that transmit Optimized Bandwidth Management messages.

This Command: cnfportstats 10.1

Statistic Type:

cnfrobparm (Configure Robust Alarms Parameters)

The **cnfrobparm** command sets parameters associated with the Robust Alarms feature.

In Release 9.2, there are robust alarms for certain alarm conditions that appear in the maintenance log or in the node user interface but are not also reported as SNMP traps to the customer NMS. (Such traps are generated by the Cisco WAN Manager RTM proxy upon receiving Robust Alarms from a switch.) Robust Alarm messages are generated by the following alarm conditions:

- Power supply, temperature, fan, and DC voltage level alarms
- Connection AIS alarm
- Bus failure
- External clock source failure
- Multiple invalid login attempts on a user port
- Excessive CPU and memory usage on switch processor card

In Release 9.2, the BPX generates power supply, temperature and fan alarms as is currently done for the IGX.

Attributes

Jobs: No Log: No Lock: Yes Node Type: IGX, BPX

Associated Commands

none

Syntax

cnfrobparm <index> <value>

<index> Specifies the parameter to configure.

<value> Specifies new value to be entered for the parameter.

Function

This command sets Robust Alarms parameters. Robust Alarms is a protocol for node-to-Network Management System (NMS) communications. When a node has statistics or alarm information for the NMS, it requires a confirmation from the NMS that the database has been updated. Table 1-32 lists the parameters. Figure 1-41 illustrates the command.

Table 1-32 cnfrobparm Parameters and Descriptions

No.	Parameter	Description	Default
1	Robust State wakeup timer	The Robust State machine becomes active after the specified time period has elapsed. If this timer value increases, the state machine operates less often and places less load on the controller card. Units of measure are seconds.	10 seconds
2	Robust update timer	Once a message has gone to the NMS, another message does not go until this timer expires. Units of measure are seconds.	10 seconds
3	Robust acknowledgment timeout	An acknowledgment must be returned by the NMS within this time period or it is assumed the communications link is down. Units of measure are seconds.	600 seconds
4	Robust acknowledgment reset timeout	After a downed link has been repaired, the next message goes out after this time period has elapsed. The purpose of this time period is to let the link settle after the repair. Units of measure are seconds.	60 seconds

Figure 1-41 cnfrobparm—Configure Robust Alarm Parameters

2  Robust update timer (sec) .....10
3  Robust acknowledge timeout (sec) .....600
4  Robust acknowledge reset timeout (sec) .....60
    
```

This Command: cnfrobparm

Which parameter do you wish to change:

cnfslotstats (Configure Slot Statistics Collection)

The **cnfslotstats** command configures the statistics for a card slot.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: BPX

Associated Commands

dspsloterrs

Syntax

cnfslotstats <port> <stat> <interval> <eld> [**<samples>** **<size>** **<peaks>**]

- <port> Specifies the port to configure.
- <stat> Specifies the type of statistic to enable/disable.
- <interval> Specifies the time interval of each sample (1–255 minutes).
- <eld> Enables/disables a statistic. 'E' to enable; 'D' to disable.
- [samples] Specifies the number of samples to collect (1–255).
- [size] Specifies the number of bytes per data sample (1, 2 or 4).
- [peaks] Enables the collection of one minute peaks. 'Y' to enable; 'N' to disable.

Function

This command sets the collection interval for each of the BPX node slot statistics. The default is for no statistics to be collected. The collection interval range is 1 minute–255 minutes (4 1/4 hours).

Table 1-33 lists the statistics associated with each slot in the BPX node. Figure 1-42 illustrates the command screen. This command is primarily a troubleshooting tool for use when hardware errors are experienced that may not be detected by the individual care self-test routines. An associated display command (**dspsloterrs**) is available for all users.

Table 1-33 Statistics Associated with each Slot in a BPX Node

Error	Description
Standby Bus Errors	Indicates a background test over the standby bus produced an error.
Rx Invalid Port Errors	Indicates port number was out of the range 1–3.
Polling Bus A Errors	Parity error occurred on this polling bus.
Polling Bus B Errors	Parity error occurred on this polling bus.
Bad Grant Errors	Error indicates arbiter did not issue a grant to send data before a timeout.
Tx BIP-16 Errors	Data frame transmitted had a checksum error.
Rx BIP-16 Errors	Data frame received with a checksum error.
Bframe parity errors	Errors detected in the BPX frame on the StrataBus or in a memory operation.

Table 1-33 Statistics Associated with each Slot in a BPX Node (Continued)

Error	Description
SIU Phase Errors	Serial Interface Unit on the card did not detect the frame synch properly.
Rx FIFO Sync Errors	First-In-First-Out buffer synchronization errors.
Poll Clk Errors	Polling clock errors.
CK 192 Errors	Clock 192 errors.
Monarch Specific Errors	Errors that occur on only the BXM.

You must enter the statistic type (1–9) to set the collection interval. When you enter the command, the system responds with the following prompt:

```
Collection Interval (1-255 minutes): __
```

cnftcpparm (Configure TCP Parameters)

The **cnftcpparm** command configures the TCP parameter.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dsptcpparm

Syntax

cnftcpparm <network ip throttle>

<network ip throttle> Specifies the number of times that the BCC card polls the LAN for attention requests.

Function

This command specifies the number of times per second that the BCC checks the IP addressees for attention requests. Figure 1-43 illustrates the system response when you enter **cnftcpparm**.

Figure 1-43 Configure TCP Parameters

```
Sw81            TN    SuperUser        BPX 15    9.2    Aug. 1 1998 15:46 PST
NWIP Bandwidth Throttle (Kbytes/sec): 32
```

This Command: cnftcpparm

Enter NWIP Bandwidth Throttle (Kbytes/sec):

cnftermfunc (Configure Terminal Port Functions)

Configures port functions for the IGX or BPX control and auxiliary ports. The IGX nodes support two EIA/TIA-232 asynchronous serial ports on the SCC and SCM, respectively. The BPX node supports two EIA/TIA-232 asynchronous serial ports on the BCC. In all cases, the top port is the CONTROL TERMINAL port, and the lower port is the AUX PORT. The CONTROL TERMINAL port can connect to a control terminal, Cisco WAN Manager, a direct dial-in modem, or any external EIA/TIA-232 device. The AUX PORT can connect to a printer, an auto-dial modem to call a control center, or an external EIA/TIA-232 device.

The interface specified for the port must match the equipment physically attached to the port. The baud rate and other data transmission parameters for the port are set with the **cnfterm** command. If either port is configured as an external device window, enter the **window** command to begin a session with the external device.

If the auxiliary port is configured as an autodial modem, designate a “network ID” and a “phone number.” Configuring the auxiliary port for an autodial modem enables the following to occur: When a change in alarm status happens anywhere in the network, the autodial modem attached to the auxiliary port dials the specified “phone number.” If the call goes to the TAC, the alarm is logged under the specified “network ID.” With this log, Cisco engineers are automatically notified of any problems that occur in the network.

Full Name

Configure terminal port functions

Syntax

```
cnftermfunc <a/c> <index> [escape_string | (Network_ID Dial_String)]
```

Related Commands

cnfterm, **cnfppt**, **dsptermfunc**

Attributes

Privilege	Jobs	Log	Node	Lock

                                   6. Autodial Modem

This Command: cnftermfunc

Select Control port (c) or Auxiliary port (a)
    
```

Example 2
cnftermfunc a 5 Intrepid 18007674479

Description

Configure an auxiliary port. The port configuration screen appears with “Autodial Modem” highlighted to indicate that this interface has been chosen for the auxiliary port. When an alarm occurs on the network, the modem dials 18007674479 to reach the TAC. The alarm is logged on a Cisco computer under the name “Intrepid.”

Table 1-34 shows the parameters of the **cnftermfunc** command. Table 1-35 shows the index parameters of the **cnftermfunc** command, while Table 1-36 shows the optional parameters of the **cnftermfunc** command.

Table 1-34 cnftermfunc Command—Parameters

Parameter	Description
a	Specifies that the auxiliary port will be configured.
c	Specifies that the control port will be configured.

Table 1-35 cnftermfunc Command—Index Parameters

Index	Description
Control port	1. VT100/Cisco WAN Manager 2. VT100 3. External device window

Table 1-35 cnftermfunc Command—Index Parameters (Continued)

Index	Description
Auxiliary port	<ol style="list-style-type: none"> 1. Okidata 184 printer 2. Okidata 184 printer with LOG 3. VT100 4. Alarm Message Collector 5. External Device Window 6. Autodial Modem

Table 1-36 cnftermfunc Command—Optional Parameters

Optional	Description
escape string	Specifies a string of 1 to 8 characters used to terminate a session with an external device. This parameter is valid only for “External Device Window” interfaces. The default escape string is “quit.”
network id	Specifies a string of 1–12 characters used to identify the network during an autodial connection to the TAC. This parameter is valid only for “Autodial Modem” interfaces. Any alarm status change in the network is automatically logged at Cisco by using this network ID. Contact TAC for the ID to use.
dial string	Specifies the telephone number to be dialed when the network is reporting alarm status changes via the autodial modem. This parameter is valid only for “Autodial Modem” interfaces. The “phone number” can be up to 16 characters long and normally consists of digits and commas only. A comma is used to indicate that the autodial modem should pause two seconds before continuing to dial. For example, the number “9,4083700736” would cause the modem to dial a “9,” pause two seconds, then dial the remaining digits. Contact Cisco TAC for the number.

cnftlparm (Configure Trunk-Based Loading Parameters)

The **cnftlparm** command configures the trunk based loading (TBL) parameters.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnfcmparm

Syntax

cnftlparm <index>

Parameters

Table 1-37 describes the parameters of the **cnftlparm** command.

Note Cisco Systems recommends that you leave all parameters at the default values. If you need to change a TBL parameter, first call TAC.

Table 1-37 Configurable Trunk-Based Loading Parameters

No.	Index	Description	Range	Default
1	Enable	Enables or disables automatic TBL update messages. Do not disable unless you first contact the TAC.	Yes/No	Yes
2	Normal Interval	Specifies the time interval between checks to determine if the node should send out a TBL update signaling a non-critical change in the trunk load.	0–65000 (times 100 msec)	150
3	Fast Interval	Specifies the time interval between checks to determine if the node should send out a TBL update signaling a critical change in the trunk load.	0–65000 (times 100 msec)	50
4	Low Threshold	Algorithm parameters for complex update algorithm.	1–100%	50
5	High Threshold	Algorithm parameters for complex update algorithm.	1–100%	90
6	Min. Percent Chg, Mid 1	Algorithm parameters for complex update algorithm.	1–100%	10
7	Min. Percent Chg, Mid 2	Algorithm parameters for complex update algorithm.	1–100%	6
8	Min. Percent Chg, Mid 3	Algorithm parameters for complex update algorithm.	1–100%	3

Table 1-37 Configurable Trunk-Based Loading Parameters (Continued)

No.	Index	Description	Range	Default
9	Min. Percent Chg, Upper	Algorithm parameters for complex update algorithm.	1–100%	2
10	Background Updt Count	Specifies a periodic update. 0=update disabled. If <i>Background Updt Count</i> is greater than 0, switch software multiplies it by the value you specify for <i>Normal Interval</i> .	0–1000%	0
11	Update Algorithm	Selects the update algorithm. 0=default. 1=complex update algorithm.	0 or 1	0

Function

The **cnftlparm** command lets you control the rate of update messages in conjunction with trunk-based loading. For descriptions of the trunk-based loading parameters, see Table 1-32.

Figure 1-45 shows the output of the **cnftlparm** command.

Figure 1-45 cnftlparm Parameters

```

This Command: cnftlparm

Enter parameter index:

cnftrafficgen

You can enable the Traffic Generation Test with the **cnftrafficgen** command and requires super user level permissions. The **cnftrafficgen** command interacts with the firmware, indicating that the functionality is to be turned on or off.

The **cnftrafficgen** command takes as input the following values:

- the address of the PVC.
- a flag indicating to enable or disable (E/D).
- the number of frames or cells to transmit.
- type of byte pattern to send, 1 = send all 0xff's, 2 = send all 0xAA's, 3 = send all 0x5A's.
- direction of traffic generation. For Release 9.2, only 'N' option for Network is supported

The Traffic Generation Test completes when the requested number of frames or cells has been transmitted, or when the test is explicitly disabled for the PVC. It will not remain enabled indefinitely like the OAM Loopback Test.

The Traffic Generation test does not directly log alarms. It is assumed that alarms have been reported before you decide to run this intrusive test. You can view the status of the Traffic Generation test by using the **dspttrafficgen** command on the node.

Traffic Generation Test

For traffic generation, switch software sends a "Transmit Frame/Generate Traffic Command" to the card with parameters for PVC address, enable, type of pattern to use, and traffic generation direction. For Release 9.2, both the switch software and firmware only support "network" direction for the traffic generation direction. The card then takes care of generating the traffic and continues until all frames/cells are sent or are disabled. When a card receives a disable message, it stops any traffic generation currently running. There is a **dspttrafficgen** command that lets you view the status of traffic generation, which gives you information such as the PVC, and if it is enabled or not.

Full Name

Configure traffic generation test

Syntax

cnftrafficgen <address> <E/D> <number of frames/cells> <pattern type> <N>

Related Commands

```

Last Command: cnftrafficgen 2

Next Command:

Example 2

cnftrafficgen 2

Description

Enable the Traffic Generation test on the PVC with address of XX, transmit number of XX cells, send pattern type of XX, send traffic in the direction of N (for network).

Table 1-38 describes the parameters of the **cnftrafficgen** command.

Table 1-38 **cnftrafficgen Parameters**

Parameter	Description
address	Address of PVC that you want to configure the Traffic Generation test for.
e/d	Enable or disable the Traffic Generation test on the specified PVC.
number of frames/cells	Number of frames/cells to transmit.
pattern type	Type of byte pattern to send.
N	Direction to generate traffic. In Release 9.2, only 'N' option for Network is supported.

cnftrkparm (Configure Trunk Card Parameters)

Use the **cnftrkparm** command to set specified trunk parameters for the following front cards:

- UXM/UXM-E
- ALM/B
- AIT
- BTM
- NTC
- NTM
- BNI
- BXM/BXM-E

Function

Use the **cnftrkparm** command to optimize a network for particular traffic mixes. Use this command to configure any of the trunk-specific parameters associated with a trunk card. It applies to either a FastPacket trunk or an ATM trunk. For ATM trunks, **cnftrkparm** applies to both physical and virtual trunks. Spacer queues indicated for the CLP and FECN thresholds pertain to BTM cards in an IGX node.

You can also use this command to reconfigure trunk queue depths to meet the CEPT requirement for a maximum end-to-end delay of 10 milliseconds. For this purpose, enter the following:

```
cnftrkparm <trunk number> <parameter index> <parameter value>
```

where: *trunk number* specifies the trunk.

parameter index is 2 (which corresponds to the NTS queue).

parameter value is 7 (which is the maximum allowable queue depth).

When the system receives this command and a trunk number, it displays the configurable parameters with an index number for each. The parameters vary with the trunk type, as the subsequent tables and figures show. Table 1-39, Table 1-40, and Table 1-41 list the parameters for trunks carrying FastPackets and ATM cells on different platforms as well as virtual trunks. Figure 1-46, Figure 1-47, Figure 1-48, and Figure 1-49 show the response when you specify a FastPacket line or trunk on a variety of platforms. A table follows one or two screen examples.

Configuring Virtual Trunks with cnftrkparm Command

BXM and UXM virtual trunks have all the configuration parameters for queues as physical trunks.

The integrated alarm thresholds for major alarms and the gateway efficiency factor is the same for all virtual trunks on the port. Note that BNI VTs are supported by a single queue and do not support configuration of all the OptiClass queues on a single virtual trunk.

Configuring Trunk Queues Used by Real-Time VBR and Non-Real-Time VBR Connections

Qbin values on both ports and trunks used by rt-VBR connections and nrt-VBR connections can be configured separately. (To configure Qbin values on ports, use **cnfportq**.)

Note The rt-VBR traffic type (or connection class) is supported on the IGX UXM and BPX BXM, ASI, and BNI cards. However, the rt-VBR class of service is not supported for BTM and ALM-A/B connection endpoints, nor is it supported on FastPacket trunks. It is also not supported on MGX 8850 or MGX 8220 interface shelves.

A rt-VBR connection uses the rt-VBR queue on a trunk. It shares this queue with voice traffic. The rt-VBR and voice traffic shares the default or user configured parameters for the rt-VBR queue. These parameters are queue depth, queue CLP high and CLP low thresholds, EFCI threshold, and queue priority.

A nrt-VBR connection uses the nrt-VBR queue on a trunk. The configurable parameters are queue depth, queue CLP high and CLP low thresholds, EFCI threshold, and queue priority.

- You can configure the Qbin values separately for rt-VBR and nrt-VBR classes on trunks using the **cnftrkparm** command. For rt-VBR, the **cnftrkparm** command configures Q-depth rt-VBR and Max Age rt-VBR. For nrt-VBR, the **cnftrkparm** command configures Q-depth nrt-VBR, Low CLP nrt-VBR, and High CLP nrt-VBR.

See Figure 1-52 for a sample **cnftrkparm** screen and the parameters that can be configured for the various service type queues.

For information on configuring port queues used by rt-VBR and nrt-VBR connections, see the **cnfportq** command.

Table 1-39 IGX Trunk Parameters

Index	Parameter	Description
1, 18	Yel/Red Alarm In/Out	Specifies a time period relating to when a trunk goes into a red or yellow alarm and after it comes out of the alarm state. The applicable type of alarm here stems from a physical line problem rather than from a statistical error. The purpose of this parameter is to prevent the switch from rerouting the connections after a very brief problem or from prematurely informing switch software that the trunk is back in service (after a failure). The implementation is <ul style="list-style-type: none"> The “into” alarm value is the time the card waits after a local (red) or yellow (remote) problem occurs before the card alerts switch software of the problem. The “out of” alarm value is the time the card waits after a local, physical problem is cleared before the card alerts switch software that the problem no longer exists.
2, 19	Rx/Tx Max. Age: - rt-VBR	Specifies a multiplier for 125-microsecond increments for the maximum age of rt-VBR (or voice) packets. For example, with the default of 20, the node discards rt-VBR (or voice) packets older than 2.5 seconds.
3, 20	Rx/Tx EFCN - BdataB	For packets or cells received from the trunk carrying Optimized Bandwidth Management Frame Relay, the node sets the FECN bit above this threshold.
4	Gateway Efficiency	Specifies an expected average number of FastPackets in each cell arriving from a trunk. The purpose of this parameter is to help switch software regulate bandwidth usage the cellbus in an IGX node. The range is 1.0–3.0. (This parameter does not apply to the BXM card.)
5	EFCN - Rx Space	Same as 3, 20 except that FECN - Rx Space sets the threshold in the Rx space queues in the AIT or BTM card. Rx space queues face towards the IGX node.
6, 7	Low-High CLP-Rx Space	Same as 8, 9 except this threshold is for setting CLP in receive spacer queues for data to send to the local node.

Table 1-39 IGX Trunk Parameters (Continued)

Index	Parameter	Description
8, 9	Rx High CLP (Bdata A/BdataB)	Frame relay cells/packets received from trunk with CLP bit set above this high threshold will be dropped and will continue to be dropped until the low threshold is crossed. Separate queues for Optimized Bandwidth Management and non-Optimized Bandwidth Management data. Given in terms of % of queue depth.
10, 11	Rx Low CLP (Bdata A/BdataB)	Same as for 8, 9 except sets low threshold.
12–17	Receive Queue Depth (rt-VBR, NTS, TS, BData A, BData B, High Pri.)	Reserves RAM in the trunk card for each of the receive queues in terms of the number of packets.
25, 26	Tx High CLP	Same as 8, 9 except this is threshold for setting CLP in transmit queues for data to be output to the next link.
27, 28	Tx Low CLP	Same as for 25, 26 except sets low threshold.
29–34	Transmit Queue Depth	Reserves RAM in the trunk card for each of the transmit queues in terms of the number of packets.

Note For parameter 12, the system displays the following: “Warning—don't change Voice Q size, use Max Voice Age.”

Note In Release 9.2.20, rt-VBR and voice connections both use the voice qbin on the trunk. Similarly, rt-VBR and voice traffic both share the default or user-configured voice qbin values for the trunk—Queue depth, CLP High/Low Threshold, EFCI Threshold, and Queue priority.

Table 1-40 BXM Trunk Parameters

Index	Parameter	Description
1	Q Depth - rt-VBR	Specifies the queue depth in cells for rt-VBR and voice traffic. This parameter relates to item 7, Max Age - rt-VBR: if you increase the value for Max Age - rt-VBR, the node increases the size of the rt-VBR (or voice) Packet Queue because more voice packets can accumulate due to a greater age. In Release 9.2, for BXM trunks, the rt-VBR and voice service types share the same queue (the rt-VBR queue). Similarly, for BXM trunks, rt-VBR and voice traffic share the default or user-configured voice Qbin values.
2	Q Depth - Non-TS	Specifies the queue depth in cells for non-time-stamped traffic.
3	Q Depth - TS	Specifies the queue depth in cells for time-stamped traffic.
4	Q Depth - BData A	Specifies the depth in cells for the bursty data A queue.
5	Q Depth - BData B	Specifies the depth in cells for the bursty data B queue.
6	Q Depth - High Pri	Specifies the queue depth in cells for high priority traffic.

Table 1-40 BXM Trunk Parameters (Continued)

Index	Parameter	Description
7	Max Age - rt-VBR	<p>Specifies a multiplier for 125-microsecond increments for the maximum age of rt-VBR (or voice) packets. For example, with the default of 20 microseconds, the node discards rt-VBR (or voice) packets older than 2.5 seconds. This value is the same as the default queue delay.</p> <p>The Max Age - rt-VBR (or voice) qbin threshold can be calculated as follows: $(20 * (125 \text{ microseconds}) * \text{num_ds0s}/53 \text{ cells} + 2)$ for any trunk.</p> <p>This parameter relates to item 1, Q Depth - rt-VBR: if you increase the value for Max Age - rt-VBR, the node increases the size of the Voice (or rt-VBR) Packet Queue because more rt-VBR (or voice) packets can accumulate due to a greater age.</p>
8	Red Alm - I/O (Dec)	<p>Specifies a time period relating to when a trunk goes into red alarm and after it comes out of the alarm state. The applicable type of alarm here stems from a physical line problem rather than from a statistical error. The purpose of this parameter is to prevent the switch from rerouting the connections after a very brief problem or from prematurely informing switch software that the trunk is back in service (after a failure). The implementation is:</p> <ul style="list-style-type: none"> • The “into” alarm value is the time the card waits after a local, physical problem occurs before the card alerts switch software of the problem. • The “out of” alarm value is the time the card waits after a local, physical problem is cleared before the card alerts switch software that the problem no longer exists.
9	Yel Alm - I/O (Dec)	<p>Specifies a time period relating to when a trunk goes into yellow alarm and after it comes out of the alarm state. The applicable type of alarm here stems from a physical line problem rather than from a statistical error. The purpose of this parameter is to prevent the switch from rerouting the connections after a very brief problem or from prematurely informing switch software that the trunk is back in service (after a failure). The implementation is:</p> <ul style="list-style-type: none"> • The “into” alarm value is the time the card waits after a remote, physical problem occurs before the card alerts local switch software of the problem. • The “out of” alarm value is the time the card waits after a remote, physical problem is cleared before the card alerts local switch software that the problem no longer exists.
10	Low CLP - BData A	<p>Specifies a percent of the Bursty Data A queue. When the number of cells in the queue falls below this percentage, the switch stops discarding cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1.</p>
11	High CLP - BData A	<p>Specifies a percent of the Bursty Data A queue. When the number of cells in the queue reaches this percentage, the switch begins to discard cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue.</p>
12	Low CLP - BData B	<p>Specifies a percent of the Bursty Data B queue. When the number of cells in the queue falls below this percentage, the switch stops discarding cells with CLP=1.</p>
13	High CLP - BData B	<p>Specifies a percent of the Bursty Data B queue. When the number of cells in the queue reaches this percentage, the switch begins to discard cells with CLP=1.</p>
14	EFCN - BData B	<p>Specifies the number of cells in the Bursty Data B queue that causes the switch to send congestion notification to the destination node. The default is low in relation to the default queue depth so that notification begins to go out as soon as congestion begins.</p>

Table 1-40 BXM Trunk Parameters (Continued)

Index	Parameter	Description
15	Q Depth - CBR	Specifies the depth of the queue dedicated to CBR traffic.
16	Q Depth - nrt-VBR	Specifies the depth of the queue dedicated to nrt-VBR traffic.
17	Q Depth - ABR	Specifies the depth of the queue dedicated to ABR traffic.
18	Low CLP - CBR	Specifies a percent of the CBR queue. When the number of cells in the queue falls below this percentage, the node stops discarding cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with CBR, congestion is not an expected condition.
19	High CLP - CBR	Specifies a percent of the CBR queue. When the number of cells in the queue reaches this percentage, the node begins to discard cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with CBR, congestion is not an expected condition.
20	Low CLP - nrt-VBR	Specifies a percent of the nrt-VBR queue. When the number of cells in the queue falls below this percentage, the node stops discarding cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with VBR, congestion is not an expected condition.
21	High CLP - nrt-VBR	Specifies a percent of the nrt-VBR queue. When the number of cells in the queue reaches this percentage, the node begins to discard cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with VBR, congestion is not an expected condition.
22	Low CLP - ABR	Specifies a percent of the ABR queue. When the number of cells in the queue falls below this percentage, the node stops discarding cells with CLP=1.
23	High CLP - ABR	Specifies a percent of the ABR queue. When the number of cells in the queue reaches this percentage, the node begins to discard cells with CLP=1.
24	EFCN - ABR	Specifies the number of cells in the ABR queue that causes the switch to send congestion notification to the destination node. The default is low in relation to the default queue depth so that notification begins to go out as soon as congestion begins.
25	SVC Queue Pool Depth	Specifies the collective size of the queue depth for all SVC connections.

Table 1-41 Virtual Trunk Parameters

Index	Parameter	Description
8	Red Alm - I/O (Dec)	<p>Specifies a time period relating to when a trunk goes into red alarm and after it comes out of the alarm state. The applicable type of alarm here stems from a physical line problem rather than from a statistical error. The purpose of this parameter is to prevent the switch from rerouting the connections after a very brief problem or from prematurely informing switch software that the trunk is back in service (after a failure). The implementation is:</p> <ul style="list-style-type: none"> • The “into” alarm value is the time the card waits after a local, physical problem occurs before the card alerts switch software of the problem. • The “out of” alarm value is the time the card waits after a local, physical problem is cleared before the card alerts switch software that the problem no longer exists.
9	Yel Alm - I/O (Dec)	<p>Specifies a time period relating to when a trunk goes into yellow alarm and after it comes out of the alarm state. The applicable type of alarm here stems from a physical line problem rather than from a statistical error. The purpose of this parameter is to prevent the switch from rerouting the connections after a very brief problem or from prematurely informing switch software that the trunk is back in service (after a failure). The implementation is:</p> <ul style="list-style-type: none"> • The “into” alarm value is the time the card waits after a remote, physical problem occurs before the card alerts local switch software of the problem. • The “out of” alarm value is the time the card waits after a remote, physical problem is cleared before the card alerts local switch software that the problem no longer exists.
18	Low CLP - CBR	<p>Specifies a percent of the CBR queue. When the number of cells in the queue falls below this percentage, the node stops discarding cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with CBR, congestion is not an expected condition.</p>

Table 1-41 Virtual Trunk Parameters (Continued)

Index	Parameter	Description
19	High CLP - CBR	Specifies a percent of the CBR queue. When the number of cells in the queue reaches this percentage, the node begins to discard cells with CLP=1. The default of 100% disables the function, which causes the switch to discard all cells with CLP=1 regardless of the cell count in the queue. The reason the default is 100% is that, with CBR, congestion is not an expected condition.
19	High CLP	Specifies a percent of the transmit/receive CBR queue depth. When a transmit/receive threshold is exceeded, the node discards cells with CLP=1 in the connection until the VC queue level falls below the depth specified by Low CLP.

TRK 2.4 Parameters

1 Q Depth - rt-VBR	[885] (Dec)	15 Q Depth - CBR	[600] (Dec)
2 Q Depth - Non-TS	[1324] (Dec)	16 Q Depth - nrt-VBR	[5000] (Dec)
3 Q Depth - TS	[1000] (Dec)	17 Q Depth - ABR	[20000] (Dec)
4 Q Depth - BData A	[10000] (Dec)	18 Low CLP - CBR	[60] (%)
5 Q Depth - BData B	[10000] (Dec)	19 High CLP - CBR	[80] (%)
6 Q Depth - High Pri	[1000] (Dec)	20 Low CLP - nrt-VBR	[60] (%)
7 Max Age - rt-VBR	[20] (Dec)	21 High CLP - nrt-VBR	[80] (%)
8 Red Alm - I/O (Dec)	[2500 / 10000]	22 Low CLP/EPD-ABR	[60] (%)
9 Yel Alm - I/O (Dec)	[2500 / 10000]	23 High CLP - ABR	[80] (%)
10 Low CLP - BData A	[100] (%)	24 EFCN - ABR	[20] (%)
11 High CLP - BData A	[100] (%)	25 SVC Queue Pool Size	[0] (Dec)
12 Low CLP - BData B	[25] (%)		
13 High CLP - BData B	[75] (%)		
14 EFCN - BData B	[30] (Dec)		

This Command: cnftrkparm 2.4

Physical and Virtual Parameters You Can Configure Using cnftrkparm

All virtual trunks on a BNI card are supported by a single queue, therefore you cannot configure all the Advanced CoS Management queues on a single virtual trunk.

The UXM and BXM share the same queueing architecture. The egress cell traffic out a port is queued in two stages. First they are queued per virtual interface (VI), each of which supports a virtual trunk. Within each virtual interface, the traffic is queued according to its normal Advanced CoS Management traffic type. In other words, voice, Time-Stamped, Non Time-Stamped, High Priority, BData, BDataB, CBR, rt-VBR, nrt-VBR, and ABR traffic is queued separately.

The overall queue depth of the virtual interface is the sum of all the queue depths for all the available queues. Since each virtual trunk occupies one virtual interface (VI), the overall queue depth available for the virtual trunk is that of its VI. You do not configure the virtual interface directly, however, you use the **cnftrkparm** command to configure the queues within the virtual trunk.

Although the traffic consists of Frame Relay in cells, the traffic can pass through a BPX node. Therefore, the Bursty Data queues exist in the BPX node.

BXM and UXM virtual trunks have all the configuration parameters for queues that physical trunks have. The integrated alarm thresholds for major alarms and the gateway efficiency factor is the same for all virtual trunks on the port. Note that BNI virtual trunks are supported by a single queue and do not support configuration of all the Advanced CoS Management (formerly OptiClass) queues on a single virtual trunk.

Table 1-42 provides a list of physical and virtual parameters that you can configure using **cnftrkparm**. X in the table indicates that the parameter is configurable. X* in the virtual trunk column indicates the parameter is a physical parameter, and changing the value for one virtual trunk on the port will automatically cause all virtual trunks on the port to be updated with the same value.

Table 1-42 Configurable cnftrkparm Parameters for Physical and Virtual Trunks

Description of cnftrkparm Parameters	BXM		UXM	
	Physical	Virtual	Physical	Virtual
Queue Depth - rt-VBR	X	X	X	X
Queue Depth - NTS	X	X	X	X
Queue Depth - TS	X	X	X	X
Queue Depth - Bdata A	X	X	X	X
Queue Depth - Bdata B	X	X	X	X
Queue Depth - High Priority	X	X	X	X
Queue Depth - CBR	X	X	X	X
Queue Depth - nrt-VBR	X	X	X	X
Queue Depth - ABR	X	X	X	X
Max Age - rt-VBR	X	X	X	X
Red Alm - I/O	X	X*	X	X*
Yel Alm - I/O	X	X*	X	X*
Lo/Hi CLP and EFCN Bdata A	X	X	X	X
Lo/Hi CLP and EFCN Bdata B	X	X	X	X
Lo/Hi CLP for CBR	X	X	X	X
Lo/Hi CLP for VBR	X	X	X	X
Low/Hi CLP, and EFCN for ABR	X	X	X	X
EPD and EFCN for CBR and nrt-VBR			X	X
SVC Queue pool size	X	X		
Gateway Efficiency			X	X*

cnftrkstats (Configure Trunk Statistics Collection)

The **cnftrkstats** command configures collection of statistics for a selected trunk.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dsprkstatcnf, dsprkstathist

Syntax

cnftrkstats <line> <stat> <interval> <eld> [**<samples>** **<size>** **<peaks>**]

- <line> specifies the trunk to configure.
- <stat> specifies the type of statistic to enable/disable.
- <interval> specifies the time interval of each sample (1–255 minutes).
- <eld> enables/disables a statistic. 'E' to enable; 'D' to disable.
- [samples] specifies the number of samples to collect (1–255).
- [size] specifies the number of bytes per data sample (1, 2 or 4).
- [peaks] enables/disables collection of 10-second peaks. 'Y' enables; 'N' disables.

Function

The **cnftrkstats** command is primarily a debug command. It configures the collection of statistics for a physical or virtual trunk. After displaying all statistic types for the trunk, the system prompts for “statistic type.” Enter the index number associated with the statistic.

Not all types of statistics are available for all lines. Unavailable selections appear in half-tone. Table 1-43 lists the types of statistics that are configurable for FastPacket T1 trunks and ATM T3 trunks. The subsequent figures show the screens associated with T1 packet trunks and T3 ATM trunks.

Table 1-43 Statistics Configurable for FastPacket T1 trunks and ATM T3 Trunks

Categories of Statistics Types	Categories of Statistics Types
Line faults	Line errors and errored seconds
Frame Slips and Loss	Path errors
Transmit packets dropped	Cell framing errors
Packets transmitted for various packet types	EFCN packets transmitted to bus
Packets dropped for various packet types	Queue Service Engine (QSE) cells transmitted
Bursty data CLP packets and cells dropped	Spacer packets transmitted and dropped for each of the 16 queues
Errored seconds	The number of seconds in which errors occurred

Figure 1-53 is the only screen for T1 trunks.

Figure 1-53 cnftrkstats—Configure T1 Trunk Statistics

cnftstparm (Configure Card Test Parameters)

The **cnftstparm** command sets parameters for the internal diagnostic self tests that you can perform for each card type in the node.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnfdiagparm, dspcderrs, prtderrs, tststats

Syntax

cnftstparm <tp> <freq> <s_e> <s_inc> <s_thr> <s_to> <b_e> <b_inc> <b_thr>

<tp>	Specifies the card type.
<freq>	Specifies the time between the completion of one test and the start of the next (in seconds; default is card-dependent). 1 sec–65535 secs. Default for BCC card is 1600 secs. The recommended value for the BCC card is 1600 seconds.
<s_e>	Enables/disables the card self test. 'E' to enable; 'D' to disable.
<s_inc>	Specifies the threshold counter increment for self-test failures. Counter for each card-type: each failure increments. Default 100.
<s_thr>	Specifies the failure threshold for self tests. Default 300.
<s_to>	Specifies time to wait for a self test response (in seconds). How long to wait for a response depends on the card. The recommended value for the self-test timeout value on the BCC card is 800 seconds. The value on the standby controller card will be maintained even if the active timeout value is less than 800, which prevents the self-test timeout value from changing during a switchover (after a switchcc command is run). For example, if you change the self-test timeout value to 900 on the standby controller card, and then do a switchcc , the self-test timeout value on the new active controller card will remain 900.
<b_e>	Enables/disables the card background test. 'E' to enable; 'D' to disable. Available tests depend on the card; some are not enabled.
<b_inc>	Specifies the threshold counter increment for background test failures.
<b_thr>	Specifies the failure threshold for background tests.

Function

This command sets internal diagnostic, self-test parameters. Upon receiving this command, the system displays a two-page screen illustrating each of the various card types equipped in the node along with their self-test parameters. Each card has two tests: a diagnostic self-test and a background test. The self-test affects the normal operation of the card. The background test can execute while the card is carrying traffic.

The following is a list of the configurable test parameters for each card type:

- Frequency For Test Execution (sec)
- Enable/Disable Self Test (e or d)
- Self Test Failure Increment
- Self Test Failure Threshold
- Timeout For Self Test (sec)
- Enable/Disable Background Test (e or d)
- Background Test Failure Increment
- Background Test Failure Threshold

After you enter **cnftstparm** on a BPX node, the first page of the display appears, as shown in Figure 1-62.

Figure 1-62 cnftstparm—Parameters on a BPX Node

Enter the card type at the prompt to begin modifying the test parameter.

cnfuiparm (Configure User Interface Parameters)

The **cnfuiparm** command sets various control terminal user interface parameters.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnfnodeparm, dsptsmap

Syntax

cnfuiparm <parameter number> <value>

<parameter number> Specifies the index number of the parameter to set. (See Table 1-38.)

<value> Specifies the new parameter value to enter.

Function

This command lets you set user interface parameters for the control terminal on the local node. It may be necessary to change these parameters in special circumstances, such as when you need to observe a screen for a long period of time or when modem password protection makes logging in difficult. Table 1-44 lists the user interface parameters. Figure 1-64 illustrates the associated display.

Table 1-44 User Interface Parameters that are Configurable with cnfuiparm

No.	Parameter	Description	Default*
1	Logout Time	Idle time before a local user is logged out (0=never).	20 minutes
2	VT Logout Time	Idle time before a virtual terminal user is logged out.	4 minutes
3	Prompt Time	Idle time before a parameter prompt times out.	2 minutes
4	Command Time	Idle time before a continuous command times out.	3 minutes
5	UID Privilege Level	Privilege level of User ID allowed to use control terminal. The default is 6, the lowest user-level.	6
6	Input Char Echo	If enabled, characters are echoed as you type them.	enabled
7	Screen Update Time	Time between screen updates.	2 seconds

Figure 1-64 cnfuiparm—Configure User Interface Parameters

```

This Command: cnfuiparm

Enter parameter index:

cnfuvvmchparam (Configure Channel Parameters on a UVM)

Configures default parameters for a channel or range of channels on a UVM. The parameters are:

- Voice codec unit (VCU) level
- PCM interface unit (PIU) level
- VAD threshold
- Modem threshold

See Table 1-45 for an explanation of the preceding UVM channel parameters.

Full Name

Configure UVM channel parameters

Syntax

cnfuvvmchparam <channel(s)> <value>

Related Commands

none

Attributes

Privilege	Jobs	Log	Node	Lock
0	Yes	Yes	IGX	Yes

Example 1

cnfuvvmchparam 7.1.1

Description

Configure the parameters for channels 1–23 on port 1 of the UVM in slot 7.

System Response

```

```

This Command: cnfuvmparm 7.1.

Enter VCU Noise Level/-10dB [0-15]:

Table 1-45 describes the parameters of the **cnfuvmparm** command.

Table 1-45 cnfuvmparm Parameters

Parameter	Description
channel	Specifies the channel or range of channels.
value	<p>“Value” consists of the following parameters:</p> <p>VCU is the Voice codec unit. The value for this parameter is a noise level placed in a voice packet that is added in case a voice packet is dropped. The value you can enter is a multiplier for the base noise level of -10 dB. The range is 1–15 (multiplied by -10 dB). For example, if you enter 6, the level of noise placed in a replacement packet is -60 dB.</p> <p>PIU is the PCM interface unit. The PIU performs a re-sampling and injects noise in case of lost packets. The range is 1–15 (which is a multiplier for -10 dB). For example, if you enter 6, the level of noise placed in a replacement packet is -60 dB.</p> <p>VAD is the Voice Activity Detection threshold. If the deciBel level falls below the specified limit, no packets are transmitted. The range is 0–65535 and is a multiplier of -1 dB, but typical values are around 30–40.</p> <p>Modem threshold is a threshold for modem tone detection. Below this threshold, the tone is ignored (or “not detected”). The range is 0–255 and is a multiplier of -1 dB, but typical values are around 30–40.</p> <p>All the other values appear as numbered columns. These are placeholders reserved for future development.</p>

cnfvchparm (Configure Voice Channel Parameter)

The **cnfvchparm** command modifies CVM or CVM voice channel parameters.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfCVMparm, **dspchan**

Syntax

cnfvchparm <channel(s)> <parameters>

channel(s) Specifies the voice channel number(s) to configure.
parameters Specifies values for the voice parameters (Table 1-45 lists parameters).

Function

The **cnfvchparm** command specifies voice card parameters for:

- Voice Activity Detection (VAD)
- Background noise injection
- VF channel loss
- Echo suppression
- Modem detection

Table 1-46 lists the voice parameters you can specify with **cnfvchparm**. Table 1-47 lists some calculated examples for a *sample delay* for VAD and non-VAD connections.

Different versions of firmware for the CVM present different ways of specifying the level of background noise you can select to cover awkward periods of silence at the ends of voice connections. For cards with Model A firmware, you specify the actual level in dBm (decibel) or dBmC0. For Model A cards, you can specify the noise levels with a granularity of 0.1 dBm or dBmC0. For cards with Model B firmware, you enter a number that maps to a noise level. Table 1-48 lists the numbers that correspond to the levels of injected background noise for Model B firmware.

The screen displays in Example 1 and Example 2 illustrate **cnfvchparm** applied to a Model A CDP and a Model B CDP, respectively. The display for Model A cards shows the decibel level of the injected noise. The display for the Model B shows the number that corresponds to a decibel (or dBmC0) level of background noise.

After you enter **cnfvchparm**, the system displays “Enter channel(s).” After you enter the parameters, the system requests confirmation by displaying “Reconfigure active CDP channels? (y/n).”

Without the **cnfvchparm** command, the other ways to re-configure channels are

- By switching cards
- By deleting then re-adding connections

Table 1-46 VF Channel Parameters

Parameter	Description	Default
Sample delay for VAD connections	Adds processing to speech information to prevent front-end clipping due to speech detector latency. One increment is 125 µsecs. See Table 1-47.	A8 (H)
Sample delay for non-VAD connections	Same for non-VAD circuits.	01 (H)
Background Noise	Sets the level of background noise the far-end card adds to the connection while it receives no voice packets. For Model A firmware, specify levels in actual decibels in 0.1 dB increments. For Model B firmware, see Table 1-47.	2 (H)
High Pass Filter mode	Enables/disables high-pass filter to assist in VAD and modem detect.	enabled
Floating Priority mode	When enabled, sets higher priority for modem detection on “c” and “v” channels. Effectively changes the trunk queue for the channel.	enabled
V.25 modem detect mode	Enables/disables V.25 modem-detect mode. The default is enabled with “detect-64K,” which specifies that a 2100 Hz tone indicates the presence of V.25-type modem. The options with V.25 modem detect are “disable,” “32” for 32K upgrade, and “64” for 64K upgrade. Enter “32” for fax transmission at 32 Kbps FAX Optimized ADPCM. Use the default “64” for fax transmission at 64 kbps PCM.	enabled
32K	Auto-upgrade line to 32 Kbps ADPCM when a 32K modem is detected.	disabled
64K	Automatically upgrade line to 64 Kbps clear channel PCM when a high speed modem is detected.	enabled

Table 1-47 Sample Delay Parameters

Delay for VAD and Non-VAD	Delay
01	0.125 msec.
50	10 msec.
A8	21 msec.

Table 1-48 Injected Noise Levels for Model B

Parameter 3	Injected Noise Level
00	Dynamically set noise level to match the noise detected at the other end. Requires Model B firmware on the CDP or CVM.
0	0 dBmC0 or -90 dBm
1	18 dBmC0 or -70 dBm
2	21 dBmC0 or -67 dBm
3	23 dBmC0 or -65 dBm
4	25 dBmC0 or -63 dBm
5	27 dBmC0 or -61 dBm
6	30 dBmC0 or -58 dBm
7	49 dBmC0 or -39 dBm

dchst (Display Channel Status)

The **dchst** command displays CDP or CVM card parameters.

Attributes

Jobs: No Log: No Lock: Yes Node Type: IGX

Associated Commands

cnfcdpparm

Syntax

dchst <channel> [interval]

<channel(s)> Specifies the voice channel number(s) to configure.

<interval> Specifies the refresh time for the data (1–60 sec.).

Function

This command displays state information for a CDP or CVM channel used for a specific connection. The interval parameter specifies the refresh time for the data. It defaults to 5 seconds. The Transmit and Receive dBm0 for both CDP or CVM indicate the input (towards the circuit line) and output power (from the circuit line) levels for the channel. Modem state indicates whether modem–detect is on or off.

Table 1-49 lists the parameters for the CDP or CVM card. Figure 1-66 illustrates the system display for a CDP or CVM.

Table 1-49 Display Channel Status Parameters for CDP or CVM

Register	Byte	Parameter	Description
0	high	zcr total	Zero Crossing Total
	low	signal state mem	Signal State Memory

diagbus (Diagnose Failed Bus)

The **diagbus** command is used to diagnose a failed IGX Muxbus or IGX Cellbus.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

none

Syntax

diagbus

Function

This command runs detailed diagnostics to isolate Muxbus problems to a failed card or bus. It is used when a minor alarm is indicated and displaying the alarm (**dsPalms**) screen indicates the message “bus needs diagnosis.”

This command can only be run locally with a terminal connected directly to the CONTROL port or remotely from a modem connection. It can not be executed through a VT (virtual terminal) command or when the node's CONTROL port is configured for Cisco WAN Manager mode.

Caution This command may cause a major disruption in service on all lines and connections and should only be run at a time when this can be tolerated.

Performing this test can result in a major disruption in the operation of the node. It should not be performed except as a last resort. To fully isolate the failure may require manual removal of cards, including controller cards and so forth. For this reason, the command may not be executed over a Virtual Terminal connection.

If the test is successful, and no problems found, the system displays:

Both buses are OK

Otherwise, the system displays various messages to the operator for additional steps to perform in isolating the problem. These messages depend on the results of the diagnostics testing.

drtop (Display Route Op Table)

The **drtop** command displays the routing table from the local node to each connected remote node.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

dsprtkcons

Syntax

drtop

Function

The **drtop** command displays the routing table from the local node to each remote node to which it connects. It shows how NPM/B.C. traffic is routed to other nodes in the network. Use **drtop** to find which trunks are used to send control cells/packets to other nodes.

The display includes remote node name, number of hops to the remote node, the trunk(s) used, and number of satellite hops if any, and the number of unused DS0s (open space) if any on the route. Figure 1-67 illustrates the display.

Figure 1-67 drtop—Display Route Op Table

BXM Card Statistics Descriptions for dspcardstats Command

Table 1-50 lists some BXM card statistics names and descriptions for the **dspcardstats** command. The table gives the objects that the BXM firmware sends to the switch software. Note that in most cases the object name and screen field name are similar or identical; however, descriptions may vary from the field names as they appear on the **dspcardstats** screen.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen

Object ID	Object Name	Range/Values	Default	Description
01	Message Tag	Byte 0-3: Tag ID Byte 4-7: IP Address	0	Identifier and source IP address sent with ComBus message. Both will be copied into the response, if any is to be sent.
02	Auto-Reset Option	0 - Disable 1 - Enable	1	Controls whether the statistics read should be automatically reset to 0.
03	Poll-Bus A Parity Errors	0 - 2 ³² -1	NA	Includes both Poll-Bus A & B Parity Errors from SIMBA.
04-05	RESERVED			
06	Tx BIP-16 Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which BXM BFrame Queue Parity errors existed.
07	RESERVED			
08	SBUS BFrame BIP-16 Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which BFrame (non-header) BIP-16 errors existed.
09	SBUS BFrame Parity Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which BFrame Header BIP-16 errors existed.
0A	RESERVED			
0B	SIU Phase Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which SIU Clock Failures or Phase Margin errors existed.
0C	Standby PRBS Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which SIU Rx errors existed.
0D-12	RESERVED			
13	Poll Clock Error Count	0 - 2 ³² -1	NA	Count of 100 msec intervals during which latched poll clock failures existed.
14	RESERVED			
15	Monarch-Specific Total Error Count	0 - 2 ³² -1	NA	Any time there is a Monarch-Specific Error occurrence (i.e. any of the errors listed in the following group of Object IDs) this counter is incremented. Hence, the software can just get this object to see if any errors have happened. If the counter is 0, then there is no need for S/W to fetch the remaining objects. If it is non-zero, then the remaining objects should be fetched to determine which error it is.
16	Utopia-2 discard error	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen (Continued)

Object ID	Object Name	Range/Values	Default	Description
17	Utopia-2 Misalign error	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed.
18	ATM Fr. Pyld Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This is the ATM frame payload parity error.
19	ATM Fr. hdr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This is the ATM frame header parity error.
1A	BFr. Hdr. Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This error is the BFrame header parity error (half-word PE using MSB as the check bit).
1B	Null BFr Header Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This error indicates that a null BFrame header was accessed.
1C	BFrame HOQ Req T/O	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This is the BFrame HOQ request time-out error.
1D	Poll Bus Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This is a generic poll-bus parity error.
1E	BFr. Queue Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed.
1F	BFr. BIP16 Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This error is the BFrame BIP-16 parity error as detected by SIMBA.
20	BFr Hdr. BIP16 Prty Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This error indicates that there was a BFrame header BIP-16 parity error.
21	MC Addr Tbl Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This error indicates that there was a Multicast Address table parity error.
22	EAP ARFD Pndg. Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected a EAP alternate Reg File Data Pending error.
23	EAP PRFD Pndg. Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected a EAP primary Reg File Data Pending error.
24	ECOE RFBD Pndg. Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected an ECOE Reg File B Data pending error.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen (Continued)

Object ID	Object Name	Range/Values	Default	Description
25	ECOE RFAD Pndg. Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected an ECOE Reg File A Data pending error.
26	MCE Q Data Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected a MCE Queue Data parity error.
27	MCE Q Hdr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that SIMBA detected a MCE Queue Header parity error.
28	MC Rec. Tbl Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed.
29	Cell Mem Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that a cell memory parity error was detected.
2A	VC T/S Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected VC T/S addr/config errors.
2B	Rx A Hdr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx A header parity errors.
2C	Rx A Payld Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx A payload parity errors.
2D	Rx A SOC OOS Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx A SOC out of sync errors.
2E	Rx A Disc Ctr Events	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx A Discard counter errors.
2F	Rx B Hdr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx B header parity errors.
30	Rx B Payld Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx B payload parity errors.
31	Rx B SOC OOS Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx B SOC out of sync errors.
32	Rx B Disc Ctr Events	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx B Discard counter errors.
33	Rx C Hdr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx C header parity errors.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen (Continued)

Object ID	Object Name	Range/Values	Default	Description
34	Rx C Payld Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx C payload parity errors.
35	Rx C SOC OOS Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx C SOC out of sync errors.
36	Rx C Disc Ctr Events	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected Rx C Discard counter errors.
37	Cell Mem Hdr PE	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected cell memory header parity errors.
38	Cell Mem Pyld PE	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the QE has detected cell memory payload parity errors.
39	FRMCP Alt. IF Crc Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected FRMCP Alternate IF CRC errors.
3A	FRMCP Pri. IF Crc Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected FRMCP Primary IF CRC errors.
3B	BRMCP Pri IF CRC Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected BRMCP Primary IF CRC errors.
3C	BRMCP Alt IF CRC Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected BRMCP Alternate IF CRC errors.
3D	OAMCP Pri. CRC Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected OAMCP Primary IF CRC errors.
3E	OAMCP Alt. CRC Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected OAMCP Alternate IF CRC errors.
3F	OAMCP Cell Fltr Parity Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected OAMCP Cell Filter parity errors.
40	ERP Exp. Rate BIP Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected ERP Explicit rate BIP errors.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen (Continued)

Object ID	Object Name	Range/Values	Default	Description
41	ERP LCN BIP Parity Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected ERP LCN BIP parity errors.
42	ERP Missing Exp. Rte Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected ERP Message explicit rate errors.
43	Rx Pri. IF Hdr PEs	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Primary I/F Header parity errors.
44	Rx Pri. IF Pyld Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Primary I/F payload parity errors.
45	Rx Pri IF SOC OOS Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Primary I/F SOC out of sync errors.
46	Rx Pri. IF Disc Ctr Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Primary I/F Discard counter errors.
47	Rx Alt. IF Hdr PEs	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Alternate I/F Header parity errors.
48	Rx Alt. IF Pyld Errors	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Alternate I/F payload parity errors.
49	Rx Alt IF SOC OOS Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Alternate I/F SOC out of sync errors.
4A	Rx Alt. IF Disc Ctr Err	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected Rx Alternate I/F Discard Counter errors.
4B	SDC Sch RAM PEs	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected SDC Extern Schedule RAM parity errors.
4C	VCSD ICG LUT PEs	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected VCSD ICG LUT parity errors.

Table 1-50 Descriptions for Statistics for BXM Card on dspcardstats Screen (Continued)

Object ID	Object Name	Range/Values	Default	Description
4D	RRC Ext Rate RAM PE	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected RRC external rate RAM parity errors.
4E	VCSA QE Sts Bus PE	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SABRE has detected VCSA Status bus parity errors.
4F	PRB Sec Req Sent Cnt	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SIMBA has detected Sec Req Send errors.
50	PRB Sec Req Acpt Cnt	0 - 2 ³² -1	NA	Count of 100 msec intervals during which this error existed. This indicates that the SIMBA has detected Sec Req Accept errors.

dspcderrs (Display Card Errors)

The **dspcderrs** command displays detailed card failure information resulting from card diagnostics testing at the local node.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

clrcderrs, **prtcdderrs**

Syntax

dspcderrs [<slot>]

[<slot>] Specifies the shelf slot in the local node.

Function

This command displays a history of card failures associated with a specified slot. If no argument is specified, a summary is displayed, indicating which slots have failures recorded against them. The command displays the results of the self tests and background tests as well as the total hardware errors.

To clear the card error counters, use the **clrcderrs** command. To obtain a hard copy of the report, use the **prtcdderrs** command. Figure 1-72 illustrates the command display.

Figure 1-72 dspcderrs—Display Card Errors

dspcftst (Display Communication Fail Test Pattern)

The **dspcftst** command displays the test pattern used for the communications fail test.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

cnfcftst

Syntax

dspcftst

Function

This command displays the test pattern used to test the controller communication path to a node that does not respond to normal controller traffic. The test pattern defaults to an alternating 8-byte sequence of 00 and FF. Refer to **cnfcftst** command for other patterns and how to reconfigure this pattern. Figure 1-73 illustrates the command display.

dspchan (Display Channel Configuration)

The **dspchan** command displays the configuration of various IGX voice channels.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX

Associated Commands

cnfcdpparm

Syntax

dspchan <channel>

<channel> Specifies the voice channel connection to display.

Function

This command displays the configuration of IGX voice channels. It is primarily a debug command and allows you to inspect the data structure defining a channel. Parameters for voice and signaling processing on a CVM voice channel are displayed by this command. Table 1-51 lists the parameters. Many of these parameters are also displayed elsewhere. Figure 1-74 illustrates the command display.

Table 1-51 Parameters Configurable on a CVM Voice Channel

dspchstatcnf (Display Statistics Enabled for a Channel)

The **dspchstatcnf** command displays the configuration of enabled statistics for a channel.

You use the **cnfcdparm** command to configure the channel statistics level (level 1, 2, or 3) on a BXM and UXM card.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfchstats, dspchstathist, cnfcdparm

Syntax

dspchstatcnf <channel>]

<channel> Specifies the channel whose statistics configuration you want to display.

Function

The **dspchstatcnf** command displays the enabled interval statistics for a channel. It is intended to help debug problems with statistics gathering. The command output is a list of the connection statistics as set by the **cnfchstats** command, by Cisco WAN Manager or by IGX features. Figure 1-75 illustrates a typical example.

The Owner column identifies who or what set the statistic. If the Owner column shows "Automatic," the node's features set the statistic. If the node name appears under Owner, Cisco WAN Manager set the statistic. If the user name appears under Owner, the **cnfchstats** command executed from the command line interface set the statistic.

Figure 1-75 dspchstatcnf—Display Channel Statistics Enabled (FR channel)

This Command: dspchstatcnf 5.1.100.100

Continue?

dspchstathist (Display Statistics History for a Channel)

The **dspchstathist** command displays a history of statistics configured as enabled for a channel.

You can use the **cnfdparm** command to configure the channel statistics level on the BXM and UXM cards.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnfchstats, **cnfchlevel**, **dspchstatcnf**

Syntax

dspchstathist <channel> <stat> <owner> <interval>

<channel>	Specifies the channel.
<stat>	Specifies the number of the statistic to view.
<owner>	Specifies the source of the selected statistics's original configuration (the choices are "auto," "user," and "tftp").
<interval>	Specifies the time period of statistics collection to display.

Function

This command displays a history of the enabled statistics for a selected channel. It is intended for debugging problems with statistics gathering. It displays the data for the number of samples specified in the configuration of the channel statistic. You select a statistic from the list in the **dspchstathist** display. Specify only an enabled statistic.

Use the **dspchstatcnf** command to display the statistics enabled on the selected channel. Record the statistics types enabled, the collection interval, and owner; you will need this information to obtain the statistics history. Use **cnfchstats** to enable a statistic if it is not already enabled. Figure 1-76 illustrates a display for channel 6.1 packets transmitted (1 second interval) history.

Note You may have to enter owner "auto" in all capital letters.

Next Command:

dspchstats (Display All Enabled Statistics for a Channel)

Use the **dspchstats** command to display all statistics configured as enabled for a selected channel. (This is referred to as a “summary statistics” command.)

For descriptions of **dspchstats** fields for the BXM card, refer to Table 1-47. Note that the object names given in the table may not match what appears on the screen. Similarly, the descriptions given may vary in some cases for actual behavior for a particular **dspchstats** statistic. (Field names will be provided in the FCS release of this document.)

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnfchstats, **dspchstatcnf**

Syntax

dspchstats <channel> [interval]

<channel> specifies the channel defined according to the channel type (*slot.port.vpi.vci*, *slot.port.DLCI*, or *slot.port* for ATM, Frame Relay, or voice or data, respectively).

<interval> specifies the time interval of each sample (1–255 minutes).

Function

This command displays the enabled statistics for the selected channel. It is intended for debugging problems with statistics gathering. It displays the data for the last five occurrences of the channel statistic. You select the channel statistic from the list displayed when you first enter the command.

Use the **dspchstats** command to display the statistics enabled on the selected channel. Record the statistics types enabled, the collection interval, and owner—you will need this information to get the statistics history. Use **cnfchstats** to enable a statistic if it is not already enabled. You can use **cnfchlevel** to configure a BXM or UXM card to additional levels of statistics (level 2 and level 3) in addition to level 1 statistics. Figure 1-77 shows a display for channel statistics on a UXM port.

Descriptions for Statistics Fields on dspchstats

Table 1-52 gives some descriptions for fields on the **dspchstats** screen.

Note The object name does not necessarily map functionally in all cases to the screen field name, but in most cases provides a description of the function of the field.

Table 1-52 Descriptions for dspchstats Fields for BXM Card

Object ID	Object (Field) Name	Range/Values	Default	Description
01	Message Tag	Byte 0-3: Tag ID Byte 4-7: IP Address	0	Identifier and source IP address sent with ComBus message. Both will be copied into the response, if any is to be sent.
03	LCN	1 - 64K	R	Identifies which channel to collect statistics.
05	Rx Cells From Port	0 - 2 ³² -1	N/A	Number of cells received at the ingress of the connection. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
06	Rx EOFs From Port	0 - 2 ³² -1	N/A	Number of EOFs received at the ingress of the connection. [A:ALL, B:12, B:28]
07	Rx Cells to Backplane	0 - 2 ³² -1	N/A	Number of cells rx'd at the ingress that were sent to the backplane. [A:ALL, B:ALL]
08	Rx CLP=1 Cells From Port	0 - 2 ³² -1	N/A	Number of cells received at the port with CLP=1. [A:ALL, B:ALL] (Note: This count is retrieved from the RCMP chip.)
09-0B	RESERVED			
0C	Rx EFCI=1 Cells From Port	0 - 2 ³² -1	N/A	Number of cells received at the port with EFCI=1. [A:28, B:28]
0D	RESERVED			
0E	Non-Compliant Cell Count (Total)	0 - 2 ³² -1	N/A	Number of cells received at the ingress of the connection that were non-compliant discarded. [A:ALL, B:ALL]. (Note: this is a 16-bit counter in the hardware -- it can wrap in less than a second depending upon non-compliant rate.)
0F	Non-Compliant Cell Count (CLP 0 Only)	0 - 2 ³² -1	N/A	Number of CLP 0 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware -- it can wrap in less than a second depending upon non-compliant rate.)

Table 1-52 Descriptions for dspchstats Fields for BXM Card (Continued)

Object ID	Object (Field) Name	Range/Values	Default	Description
10	Non-Compliant Cell Count (CLP 1 Only)	0 - 2 ³² -1	N/A	Number of CLP 1 cells received at the ingress of the connection that were non-compliant dropped. [A:ALL, B:ALL]. (Note: This is a 16-bit counter in the hardware—it can wrap in less than a second depending upon non-compliant rate.)
11	Ingress VC Q Depth	0 - 2 ³² -1	N/A	Current Ingress VC Queue Depth. [A:ALL, B:ALL]
15	Rx Rsrc Ovfl Discards	0 - 2 ³² -1	N/A	Number of cells received at the port that were discarded due to Resource Overflow. [B:ALL]
16-1E	RESERVED			
1F	Tx Cells From Network	0 - 2 ³² -1	N/A	Number of cells received from the backplane. [A:ALL, B:ALL]
20	Tx CLP=1 To Port	0 - 2 ³² -1	N/A	Number of cells transmitted out the port with CLP=1. [A:ALL, B:12, B:28]
21	Tx EFCI=1 To Port	0 - 2 ³² -1	N/A	Number of cells transmitted out the port with EFCI=1. [A:12, A:28, B:12, B:28]
22	Tx Cells To Port	0 - 2 ³² -1	N/A	Number of cells transmitted out the port. [A:ALL, B:ALL]
23-26	RESERVED			
27	Loopback RTD Measurement	0 - 2 ³² -1	N/A	The Loopback Round Trip Delay measurement in msec. (Still under investigation.) Used to initiate the measurement (Set). The Get is used to get the last measurement known; or zero if now known.
28	Local Ingress Rx State	0 : Okay 1 : FERF (aka RDI) 2 : AIS	0	The OAM connection state. [A:ALL, B:ALL]
29	Rx CLP=0 Congested Discards	0 - 2 ³² -1	N/A	Number of CLP=0 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]
2A	Rx CLP=1 Congested Discards	0 - 2 ³² -1	N/A	Number of CLP=1 Cells received from the port and discarded due to congestion (after the policer). [A:ALL, B:None]
2B	Rx CLP=0 Cells From Port	0 - 2 ³² -1	N/A	Number of CLP=0 Cells received from the port. [A:ALL, B:ALL] (NOTE: This stat is received from the RCMP.)
2C	Tx CLP=0 Cells To Port	0 - 2 ³² -1	N/A	Number of CLP=0 Cells transmitted to the port. [A:ALL, B:12, B:28]
2D	Tx CLP=0 Cells From Backplane	0 - 2 ³² -1	N/A	Number of CLP=0 Cells received from the backplane. [A:ALL, B:28]
2E	Rx CLP=0 Cells To Backplane	0 - 2 ³² -1	N/A	Number of CLP=0 Cells sent to the backplane. [A:ALL, B:12, B:28]

Table 1-52 Descriptions for dspchstats Fields for BXM Card (Continued)

Object ID	Object (Field) Name	Range/Values	Default	Description
2F	Tx CLP=1 Cells From Backplane	0 - 2 ³² -1	N/A	Number of CLP=1 Cells received from the backplane. [A:ALL, B:28]
30	Rx CLP=1 Cells To Backplane	0 - 2 ³² -1	N/A	Number of CLP=1 Cells sent to the backplane. [A:12, A:28, B:12,B:28]
31	Rx EFCI=0 Cells From Port	0 - 2 ³² -1	N/A	Number of EFCI=0 Cells received from the port. [A:28, B:28]
32	Tx EFCI=0 Cells To Port	0 - 2 ³² -1	N/A	Number of EFCI=0 Cells transmitted to the port. [A:12,A:28, B:12, B:28]
33	Tx EFCI=0 Cells From Backplane	0 - 2 ³² -1	N/A	Number of EFCI=0 Cells received from the backplane. [A:28, B:28]
34	Rx EFCI=0 Cells To Backplane	0 - 2 ³² -1	N/A	Number of EFCI=0 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
35	Tx EFCI=1 Cells From Backplane	0 - 2 ³² -1	N/A	Number of EFCI=1 Cells received from the backplane. [A:28, B:28]
36	Rx EFCI=1 Cells To Backplane	0 - 2 ³² -1	N/A	Number of EFCI=1 Cells sent to the backplane. [A:12, A:28, B:12, B:28]
37	Tx EOFs to Port	0 - 2 ³² -1	N/A	Number of cells with EOF sent to the port. [A:12, A:28, B:28]
38	Tx EOFs from Backplane	0 - 2 ³² -1	N/A	Number of EOFs received at the backplane. [B:12, B:28]
39	Rx EOFs to Backplane	0 - 2 ³² -1	N/A	Number of cells with EOF sent to the backplane. [B:28]
3A	Rx Segment OAM	0 - 2 ³² -1	N/A	Number of Segment OAM cells received at the port. [A:28, B:28]
3B	Tx Segment OAM	0 - 2 ³² -1	N/A	Number of Segment OAM cells received at the egress. [A:28, B:28]
3C	Rx End-to-End OAM	0 - 2 ³² -1	N/A	Number of End-to-End OAM cells received at the port. [A:28, B:28]
3D	Tx End-to-End OAM	0 - 2 ³² -1	N/A	Number of End-to-End OAM cells received at the egress. [A:28, B:28]
3E	Rx Forward RM Cells	0 - 2 ³² -1	N/A	Number of Forward RM cells received at the port. [A:28, B:28]
3F	Tx Forward RM Cells	0 - 2 ³² -1	N/A	Number of Forward RM cells received at the backplane. [A:28, B:28]
40	Rx Backward RM Cells	0 - 2 ³² -1	N/A	Number of Backward RM cells received at the port. [A:28, B:28]
41	Tx Backward RM Cells	0 - 2 ³² -1	N/A	Number of Backward RM cells received at the backplane. [A:28, B:28]
42	Rx Optimized Bandwidth Management RM Cells	0 - 2 ³² -1	N/A	Number of Optimized Bandwidth Management RM cells received at the port. [B:28]

Table 1-52 Descriptions for dspchstats Fields for BXM Card (Continued)

Object ID	Object (Field) Name	Range/Values	Default	Description
43	Tx Optimized Bandwidth Management RM Cells	0 - 2 ³² -1	N/A	Number of Optimized Bandwidth Management RM cells received at the backplane. [B:28]
44	Rx Undefined RM Cells	0 - 2 ³² -1	N/A	Number of Undefined RM cells received at the port. [B:28]
45	Tx Undefined RM Cells	0 - 2 ³² -1	N/A	Number of Undefined RM cells received at the backplane. [B:28]
46	Tx Rsrc Ovfl Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the backplane that were discarded due to Resource Overflow. [B:ALL]
47	Rx VI Cell Discards	0 - 2 ³² -1	N/A	Number of cells received at the port that were discarded because of a full Vi. [B:12, B:28]
48	Tx VI Cell Discards	0 - 2 ³² -1	N/A	Number of cells rx'ed at the backplane discarded because of a full Vi. [B:12, B:28]
49	Rx QBIN Cell Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the port discarded due to QBIN threshold violation. [B:12, B:28]
4A	Tx QBIN Cell Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the backplane that were disc. due to QBIN threshold violations. [B:12, B:28]
4B	Rx VC Cell Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the port that were disc. due to VC threshold violations. [B:12, B:28]
4C	Tx VC Cell Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the backplane that were discarded due to VC threshold violations. [B:ALL]
4D	Rx Cell Filter Discards	0 - 2 ³² -1	N/A	Number of cells received at the port that were discarded due to cell filter action. [B:12, B:28]
4E	Tx Cell Filter Discards	0 - 2 ³² -1	N/A	Number of cells rx'd at the backplane that were discarded due to cell filter action. [B:12, B:28]
4F	Rx Illegal Event Cells	0 - 2 ³² -1	N/A	Number of cells rx'd at the port that caused an reserved event in the hardware. [B:28]
50	Tx Illegal Event Cells	0 - 2 ³² -1	N/A	Number of cells rx'd at the backplane that caused an reserved event in the H/W. [B:28]
51	Ingress VSVD ACR	0 - 2 ³² -1	N/A	Ingress VSVD allowed Cell Rate. [A:ALL, B:ALL]
52	Egress VSVD ACR	0 - 2 ³² -1	N/A	Egress VSVD allowed Cell Rate. [A:ALL, B:ALL]
53	Egress VC Q Depth	0 - 2 ³² -1	N/A	Current Egress VC Queue Depth. [A:ALL, B:ALL]

Table 1-52 Descriptions for dspchstats Fields for BXM Card (Continued)

61	SAR Good PDUs Xmt	0 - 2 ³² -1	N/A	Number of good PDUs transmitted by the SAR. [A:ALL, B:ALL]
62	SAR Rcv PDUs Discarded	0 - 2 ³² -1	N/A	Number of PDUs discarded on the ingress by the SAR. [A:ALL, B:ALL]
63	SAR Xmt PDUs Discarded	0 - 2 ³² -1	N/A	Number of PDUs discarded on the egress by the SAR. [A:ALL, B:ALL]
64	SAR Invalid CRC PDUs Rcvd	0 - 2 ³² -1	N/A	Number of invalid CRC32 PDUs received by the SAR. [A:ALL, B:ALL]
65	SAR Invalid Length PDUs Rcvd	0 - 2 ³² -1	N/A	Number of invalid-length PDUs received by the SAR. [A:ALL, B:ALL]
66	SAR Short Length Failures	0 - 2 ³² -1	N/A	Number of short-length failures detected by the SAR. [A:ALL, B:ALL]
67	SAR Long Length Failures	0 - 2 ³² -1	N/A	Number of long-length failures detected by the SAR. [A:ALL, B:ALL]

dspclnstatcnf (Display Circuit Line Statistics Configuration)

The **dspclnstatcnf** command displays statistics configured as enabled for a selected circuit line.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfclnstats

Syntax

dspclnstatcnf <line>

<line> Specifies the circuit line in the format *slot* or *slot.line*. If the card has only one line, you can enter just the slot.

Function

This command displays the circuit line statistics as enabled by the **cnfclnstats** command, by Cisco WAN Manager or by IGX features. See Figure 1-78 for an example display.

The Owner column shows what set the statistic. If the owner is “Automatic,” the statistic was derived from the features. If the node name appears under Owner, the statistic came from Cisco WAN Manager. If “User” is under Owner, the source of the statistic was the **cnfchstats** command.

Figure 1-78 dspclnstatcnf—Display Circuit Line Statistics Enabled (T1 line)

```

dspclnsthsthist (Display Statistics History for a Circuit Line)

The **dspclnsthsthist** command displays a history of statistics enabled for a circuit line.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfclnstats, **dspclnstatcnf**

Syntax

dspclnsthsthist <line> <statistic number> <interval> <owner>

<line> Specifies the circuit line in the format *slot.line*. If the card set supports only one line, you can enter just the slot number.

<statistic
number> Specifies the type of statistic to enable/disable.

<interval> Specifies the time interval of each sample (1–255 minutes).

<owner> Specifies the source of the configuration (“auto,” “user”, or “tftp”).

Function

This command displays the last five occurrences of the circuit line statistic. The circuit line statistic is selected from the list displayed when you first enter this command. Use the **dspclnstatcnf** to display the statistics enabled for the selected channel. Use **cnfclnstats** to enable a statistic.

Figure 1-79 illustrates a display for T1 circuit line 14 bipolar violations (60 second interval) history.

Note You may have to enter owner “auto” in all capital letters.

Figure 1-79 dspclnstat—Display Circuit Line Statistics History

Next Command:

dspcnf (Display Configuration Save/Restore Status)

The **dspcnf** command displays the status for the configuration save/restore processes on all nodes in the network.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

savecnf, **loadcnf**, **runcnf**

Syntax

dspcnf

Function

This command displays the status for the configuration save/restore process. The display lists the various nodes, the backup ID name of the saved configuration, the time and date saved, and the Cisco WAN Manager terminal it is saved on. See Figure 1-80 for an example.

If the status displays “Reserved for Firmware,” a firmware image is being maintained in memory after being loaded. Use the **getfwrev 0.0** command to clear the firmware image. Likewise, if a configuration image is displayed, clear the old configuration image using **savecnf clear** or **loadcnf clear**.

Caution Do not use **clrcnf** without discussing the action with TAC.

Figure 1-80 **dspcnf—Display Configuration Save/Restore Status**

```

Last Command: dspcnf

Next Command:

dspdnl (Display Download)

The **dspdnl** command displays the status of a download to a nodes.

Attributes

Jobs: No Log: Yes Lock: No Node Type: IGX, BPX

Associated Commands

loadrev, **getfwrev**

Syntax

dspdnl

Function

This command displays the status of any software or firmware download operation from Cisco WAN Manager to the node controller card. You should be connected to the node being downloaded either directly or via virtual terminal connection. The display download command shows:

- download destination—Node currently being downloaded.
- download type—Destination of the downloaded image, standby RAM or active or standby ROM, or firmware.
- download source—Where the image to be downloaded is currently stored, Cisco WAN Manager or Cisco WAN Manager, standby controller, active or standby controller, or remote node.
- download image—Where the image is located, ROM or RAM.

This command can be used to check how far along the download has progressed. Figure 1-81 illustrates the command screen. Blocks of data already downloaded appear highlighted; the remaining blocks appear dim. If there was no download initiated when this command was entered, the blocks of data will appear as all zeros.

Last Command: dspdnld

Next Command:

dspdutl (Display Data Channel Utilization)

The **dspdutl** command displays the percentage of channel utilization of data connections.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX

Associated Commands

dspdutl

Syntax

dspdutl <start bslot> [clear]

<start bslot> Specifies the slot where the data card is located.

[clear] Specifies that all data channel utilization buffers should be cleared after the display.

Function

This command displays the percentage utilization for the data connections starting at the back slot (bslot) number you specify. All data connections for the node are displayed (maximum of 32).

The percentage is calculated by dividing the number of packets transmitted over the total number of packets allocated to the specified channel. Only transmit packet rates are used. If percentage use exceeds the use configured, the channel appears in reverse video.

Figure 1-82 illustrates a display where there is very low utilization (2%) on three of the four ports and no utilization of the fourth port. Use the clear option to clear all slots. Use **dspdutl** to display utilization for voice channels.

dspecparm (Display Echo Canceller Parameters)

The **dspecparm** command displays statistics configured as enabled for a selected CDP echo canceller.

Attributes

Jobs: No Log: Yes Lock: No Node Type: IGX

Associated Commands

cnfecparm

Syntax

dspecparm <line>

<line> Specifies the circuit line to display.

Function

This command displays the Integrated Echo Canceller card parameters associated with the specified circuit line. These parameters are set using the **cnfecparm** command. Table 1-53 lists the parameter options. Figure 1-83 illustrates a typical display.

Table 1-53 Echo Canceller Parameters

Number	Parameter	Description
1	Echo Return Loss High	Maximum ERL required for echo canceller to be enabled.
2	Echo Return Loss Low	Minimum ERL required for echo canceller to be enabled.
3	Tone Disabler Type	Selection of protocol to enable tone disabler.
4	Non-Linear Processing	Selects type of post-canceller signal.
5	NLP Threshold	Threshold to enable non-linear processing.
6	Noise Injection	Determines if noise will be injected when NLP is active.
7	Voice Template	Selection of echo canceller template to use.

dspfwrev (Display Firmware Revision)

The **dspfwrev** command displays the status of card firmware revision image loaded in the controller card's RAM.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

getfwrev, **burnfwrev**

Syntax

dspfwrev

Function

This command displays the revision level and an indication of the length of the firmware in the controller card. It may require two screens to display all the parameters. Figure 1-85 illustrates the screen display. You can use this command while firmware is downloading to a node to get an idea of how far along the downloading process has progressed. The blocks already downloaded appear normal. Blocks that are yet to be downloaded appear shaded.

If no **getfwrev** command was issued, nothing displays. If “Configuration image present” displays, use the **loadcnf clear** command to clear this status.

dsphitless (Display Statistical History of Hitless Rebuilds)

The **dsphitless** command displays the statistical history of hitless rebuilds that may have occurred within the configured thresholding period. This thresholding period is described under the **cnfnodeparm** command, under Index #42, Maximum Hitless Rebuild Count, and Index #43, Hitless Counter Reset Time parameters.

A statistical history of hitless rebuilds are stored in BRAM, and will survive a full rebuild. Two records of hitless rebuilds are maintained: one will contain information that is within the current thresholding window. When a full rebuild occurs, the hitless rebuild statistics from the current window will be moved to a saved area, and a new current window will begin.

You can enter some optional parameters with the **dsphitless** command, which displays either a summary screen or a detailed screen giving the history of hitless rebuilds. There can be two different versions of each screen, one for the current window and one for the saved previous window. See the Syntax section below for a list of optional parameters you can use with the **dsphitless** command.

If you do not provide any optional parameter, then the default values shown under “Syntax” will be used.

Refer to the screen under System Response to display the time and cause of each hitless rebuild that has occurred since the statistical record of hitless rebuilds was last cleared.

What Hitless Rebuild Feature Provides in Release 9.2

The Hitless Rebuild feature provides the ability for a node to effectively rebuild without affecting user traffic. It substantially decreases the time it takes for the BPX software to settle into its normal operating state after a rebuild.

Note The Hitless Rebuild feature is internal to the switch software on a node. If there is a problem with the node, switch software takes care of it; no user intervention is needed. Following information is provided to explain what happens in switch software when a hitless rebuild occurs.

In recent releases, much work has gone into the control software to prevent restarts. Better queue memory management techniques, faster standby updates, Soft Reset, and Rebuild Prevention are all examples. However, if it is necessary to restart the control software, and a switchover is not possible, then the node will still do a full rebuild. A node with many connections may take a couple of hours to restore itself fully to the network. In the meantime, it is in communication break with some nodes and some network connections are not routed or are not on their preferred routes.

The way to prevent rebuilds is to be able to do a software restart on the processor card without doing a full rebuild of the system. In particular, it is necessary to avoid resetting the line or trunk cards, or interfere with user traffic in any way during the control software restart. This concept is known as a "hitless rebuild".

Purpose of Hitless Rebuild

Hitless Rebuild is a modification of control software restart to prevent a full configuration rebuild of the node being done. During most software restarts, the interface cards are not reset to preserve their configurations. In particular, the case where the standby processor card is failed or absent, and the active card must abort will no longer cause a full rebuild.

Acronyms

- BRAM** Battery-backed RAM. This is where permanent configuration information for a node is kept.
- CC** Control Card, or processor card. The control card on the BPX is the BCC.
- DB** Database. An element in the current configuration state of the system. This includes both derived information, such as current route, and configured information, such as preferred route. Some databases are stored in BRAM so that they survive system initializations and power outages. The Hitless Rebuild feature in Release 9.2 affects databases stored in RAM.
- pSOS** The off-the-shelf operating system kernel used with switch software that runs on the BPX and IGX.

Software Revisions and Interoperability

The Hitless Rebuild feature requires Release 9.2 or later switch software, and works on both the BPX and IGX platforms. This feature is local to a node. Hitless Rebuild will function correctly on nodes that are running software that contains the feature, even in a network with mixed software releases, some of which do not have the feature.

Hitless Rebuild will operate during upgrades, but will not operate during a downgrade. If a failure occurs that would normally result in a controller card switchover, but the switchover needs to be suppressed due to the different software releases running on the two processors, then a hitless rebuild will be done instead.

If a backoff must be done from an upgrade, then a full rebuild will occur. A *backoff* refers to the state where the new switch software revision has been loaded as the secondary image, and the decision is made to go back to the original revision.

There are no operational problems if, during an upgrade, the new release of software has the Hitless Rebuild feature and the older release does not. Hitless Rebuild will just operate on the processor card with the newer release.

Description of how Hitless Rebuild Works

The purpose of the Hitless Rebuild feature is to minimize the impact on user traffic when a processor card must reinitialize. Unlike with a full rebuild, the effect of a control plane failure should have minimal impact upon the user plane. Line and trunk cards should not be reset during a hitless rebuild. Rather than having a node with many connections take up to two hours to restore itself fully to the network, a hitless rebuild will take, at most, only a little longer than a processor card switchover. All existing user connections should be maintained through the initialization. LMI continuity and trunk state should also be preserved.

During a traditional full rebuild, all databases are rebuilt from BRAM. The approach to doing a hitless rebuild is to maintain databases that cannot be rebuilt without affecting user connections, and to rebuild from BRAM any that will not affect user connections. Some key consistency checking of the preserved databases will be performed, such as topology consistency checking, to ensure that the hitless rebuild will work.

In general, almost all software aborts will result in a processor card switchover. If this is not possible, then a hitless rebuild will usually be done. Hitless rebuild is used only when a switch to the standby processor card is not possible or reasonable. For more details on specific types of potential problems that lead to hitless rebuilds or other types of initializations, see Table 1-53, Echo Cancellation Parameters.

The main functional difference in behavior from previous switch software release is that after a rebuild, the control software will settle quickly into its normal operating state, rather than taking a very long time to reset cards and reroute connections.

You use the CLI to enable/disable the Hitless Rebuild feature, and to configure the maximum frequency of hitless rebuilds that can occur before the node enters degraded mode, or a full rebuild is performed.

Most aspects of a full rebuild and a hitless rebuild function the same way. For example, initial synchronization between the switch and Cisco WAN Manager and the loss of statistics information will remain the same.

Safe Switchover

Sometimes shortly after a switchover, the new active processor card will run some diagnostics and detect a failure, causing it to switch back to the original active card. The Hitless Rebuild feature will improve this situation under most conditions. Following any processor card switchover, the new standby will rebuild, preserving the key databases needed for a hitless rebuild (11 seconds). When database updates can start, the standby will rebuild again doing a normal standby rebuild (11 seconds). If there is a failure on the new active card that causes it to switch back before updates can start, the card taking over will do a hitless rebuild. If the active processor card fails while still updating its standby, it will perform a hitless rebuild.

The time it takes the updates to complete to the standby card is 15–25 minutes. A full active rebuild takes about 45 seconds. (These numbers are based on measurements done in Release 8.4.)

Action Taken if the Control Card Fails

During any active control card failure, a decision must be made about the type of initialization to undertake. Table 1-54 shows the possible conditions and the corresponding actions to take.

Table 1-54 What Happens when a Control Card Restarts or Aborts

Reason	Standby Ready	Standby Updating	Standby Not Ready Not Updating	Standby State Un-known	Standby Does not exist	Standby in Upgrade	Standby State not applicable

User Command - clrallcnf - clrncf - resetcd H	N/A	N/A	N/A	N/A	N/A	N/A	full rebuild
Bad Comm Bus	N/A	N/A	N/A	N/A	N/A	N/A	Degrade Mode
Bus Diagnostics (destructive)	N/A	N/A	N/A	N/A	N/A	N/A	full rebuild
configuration Changes - runcnf	N/A	N/A	N/A	N/A	N/A	N/A	full rebuild
bad BCC card	switch	ignore	ignore	ignore	ignore	ignore	N/A
Bad Crosspoint	ignore	ignore	ignore	ignore	ignore	ignore	ignore
Preparation for revision change (happens only on the standby card)	N/A	N/A	N/A	N/A	N/A	N/A	full standby rebuild
Revision Switch	switch	N/A	N/A	N/A	N/A	N/A	Hitless rebuild on standby
primary Revision Change	N/A	N/A	N/A	N/A	N/A	N/A	Full rebuild on either card
starting the updates to the standby card - message is sent by the active card	N/A	N/A	N/A	N/A	N/A	N/A	Full rebuild on the standby card

Table 1-54 What Happens when a Control Card Restarts or Aborts (Continued)

Reason	Standby Ready	Standby Updating	Standby Not Ready Not Updating	Standby State Un-known	Standby Does not exist	Standby in Upgrade	Standby State not applicable
User switchcc (switchcc) (hitless on standby card)	switch	- switch - full rebuild on newly active - hitless rebuild on standby	switch - hitless rebuild on standby -active rebuild depends on rebuild flag state	N/A	N/A	N/A	Hitless rebuild on the standby card

When a controller card switchover to the new card occurs, the new standby card (unless shown differently in Table 1-54) will perform a hitless rebuild maintaining the databases. These databases will be maintained, allowing this card to take over without affecting traffic until the updates are started. After the updates have started, the new standby card will do a full rebuild to get ready to receive the updates. The duration of the standby updates are 15–25 minutes (based on Release 8.4 measurements).

When the threshold is exceeded and the node is to enter degraded mode, a hitless rebuild will take place first, and degraded mode will be entered after the hitless rebuild completes.

Autobus Diagnostic Feature Disabled

As part of the Hitless Rebuild feature, the Autobus diagnostic feature on the node will be disabled. This is done because the feature is destructive, and it requires the node to undergo a series of full rebuilds causing the node to be out of the network for a long duration of time.

How Memory is Managed during Hitless Rebuilds

Full rebuilds result in the complete initialization of all RAM memory regions. Before the Hitless Rebuild feature, there was no need to save any databases in RAM through an initialization. All databases were rebuilt from configuration stored in BRAM. For a rebuild to be hitless, databases containing certain types of critical information related to trunks, connections, and so on., must survive intact in RAM.

Configuration data that must survive a hitless rebuild will be moved to regions where it will remain intact. These new regions are now managed by the new memory management algorithm, and will be known as “hitless regions.”

A user logged into a node will be able to see the changes by using the Profiler. The user commands “dspprf” and “dspprfhist” show some statistics related to memory usage. (Refer to the Service commands for descriptions of **dspprf** and **dspprfhist** commands. Note that you must have service level privileges to use the debug, or Service-level commands.)

Errors and Alarm Handling

The Hitless Rebuild feature does not cause many changes to errors or alarms. However, most of the conditions that cause a hitless rebuild will themselves generate errors or alarms. There are no changes to these.

The Hitless Rebuild feature introduces two new events, indicating the end of a hitless rebuild or a full rebuild. These will be logged into the local event log on the node (which you can view with **dspllog**).

Corresponding Robust Card Alarm messages will also be sent from the node to Cisco WAN Manager, and these will result in traps being generated and sent to Cisco WAN Manager's RTM proxy. The traps will make the information available to external network management systems that register for traps on Cisco WAN Manager.

As always, the Robust Alarm mechanism does not guarantee that all alarm state transitions will result in messages being sent to Cisco WAN Manager. The mechanism guarantees that "current state" information will be sent. However, when multiple transitions occur close together, only the last one is guaranteed. During a rebuild, a few changes may occur quickly.

The Robust Card Alarm messages sent to Cisco WAN Manager have the following values:

Trap Type: The current state of the card. (Fail, Active, Down, and so on.)
Alarm Class: (1) Info
Reason: (3107) BCC Completed hitless rebuild.
(3108) BCC Completed full rebuild.

This Robust Card Alarm messages will result in Cisco WAN Manager traps of the following type:

TrapType: (20004) Card Alarm
TrapReason: (3107) BCC Completed hitless rebuild
(3108) BCC Completed full rebuild

Consistency Checking

The purpose of the Hitless Rebuild feature is to dramatically improve performance of switch software during rebuilds, and to return the node to normal operation as quickly as possible. The intent is to minimize the effect of a control plane failure on the user plane when a node must rebuild. All existing user connections must be maintained through the initialization. LMI continuity and trunk state must be preserved. Unlike a full rebuild, which will result in communication failures, a hitless rebuild will not result in communication failures.

When a hitless rebuild is completed, the node will go through consistency checks to verify the databases. Some of these include topology checking, and verification of LCONS and VIA LCONS to have valid end points. The line card consistency checks done during a hitless rebuild will be the same as that done when a switchover to the standby takes place.

The line and trunk cards should not reset during a hitless rebuild. Rather than having a node with many connections take up to two hours to restore itself fully to the network, a hitless rebuild takes, at most, only a little longer than a processor card switchover.

During normal switch operation, or during normal switchovers into hot standby processor cards, the Hitless Rebuild feature should have no impact on the performance of switch software.

Node Reliability and Maintainability

The Hitless Rebuild feature is a direct improvement to the survivability of the BPX. It significantly reduces the possibility that a failure in the control plane will cause a failure in the user plane. The main purpose of hitless rebuild is to avoid, as much as possible, affecting the user traffic through a node when processor card redundancy is unusable or itself fails and the control card software must rebuild.

Hitless Rebuild Examples

Normal switchcc

Table 1-55 shows the steps for a normal switchcc. The standby is ready (in Standby state). Up to step 4 the new standby (card 7) can do a hitless rebuild if necessary. Note that a standby card rebuild is not the same as an active card rebuild. This is the same for both normal and hitless rebuilds.

The normal abort case is almost identical to this case. In step 1, the abort causes an automatic switch. The remaining steps are the same.

Table 1-55 Steps for a Normal switchcc

Steps	Card 7	Card 8
Step 1	Active BCC	Standby BCC - Ready
Step 2	User issues 'switchcc'.	
Step 3	Does Standby Hitless Rebuild, not ready to receive updates, can do Hitless Rebuild.	Activates itself.
Step 4		Kicks off standby updates. Can now do a Hitless Rebuild.
Step 5	Does normal standby rebuild.	Waits for standby
Step 6	Enters normal standby mode, ready to receive updates, cannot do Hitless Rebuild.	
Step 7		Starts standby updates and network updates.

Abort -- Standby not Ready

Table 1-56 shows the possible actions by the active card during an abort operation when the standby card is not ready.

Table 1-56 What Happens during an Abort and Standby Card is not Ready

	Card 7	Card 8
0	Active BCC	Standby BCC - Not Ready
1	Abort occurs For example, the card ran out of memory.	
2	Does active Hitless Rebuild.	
3	Tries to start standby updates.	
4	Starts network updates.	

Commbus failure

In the case of a Commbus failure (see Table 1-57), the active card is no longer certain of the state of any other card. In particular, it can make no assumptions about the state of the standby BCC.

Table 1-57 What Happens when a CommBus Failure Occurs

	Card 7	Card 8
0	Active BCC	Standby BCC - Any
1	Commbus failure detected.	
2	Enter Degraded Mode if feature is enabled. Otherwise, a full rebuild will occur.	

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

cnfnodeparm, resetcd, switchcc, dspcds, dsplog

Function

The **dsphitless** command displays the statistical history of hitless rebuilds that may have occurred within the configured thresholding period. This thresholding period is part of the super user command **cnfnodeparm**.

Statistical history of hitless rebuilds will be stored in BRAM, and will survive a full rebuild. Two records of hitless rebuilds will be kept. One will contain information that is within the current thresholding window. When a full rebuild occurs, the hitless rebuild statistics from the current window will be moved to a saved area, and a new current window will begin.

The command **dsphitless** accepts some optional parameters, and will display either a summary screen or a detailed screen providing the history of hitless rebuilds. There can be two different versions of each screen, one for the current window and one for the saved previous window. See the Syntax section for a list of the optional parameters.

Note that you can use the f, a, c, and d options listed below on the command line at the same time (for example, **dsphitless -d -a**).

Syntax

dsphitless [summary screen (default)] or [d - detailed screen]

dsphitless [active window (default)] or [p - previous window]

dsphitless [c - clear stats for current window]

dsphitless [s - standby stats]

dsplstatcnf (Display Statistics Enabled for a Line)

The **dsplstatcnf** command displays statistics configured as enabled for a selected line.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnflnstats

Syntax

dsplstatcnf <line>

<line> Specifies the line.

Function

This command displays the line statistics as enabled by the **cnflnstats** command, by Cisco WAN Manager, or by node features. (Note that the **dsplstatcnf** command is the same as **dsplstatcnf**.) Figure 1-87 illustrates an example display.

The Owner column identifies who or what set the statistic. If the Owner column shows “Automatic,” the node’s features set the statistic. If the node name appears under Owner, Cisco WAN Manager set the statistic. If the user name appears under Owner, the **cnfchstats** command executed from the command line interface set the statistic.

dsplnsthathist (Display Statistics Data for a Line)

The **dsplnsthathist** command displays a history of statistics configured as enabled for a selected line.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnflnstats, **dsplnstatcnf**

Syntax

dsplnsthathist <line> <statistic number> <interval> <owner>

<line> Specifies the circuit line in the format *slot.line*. If the card set supports only one line, you can enter just the slot number.

<statistic number> Specifies the type of statistic to enable/disable.

<interval> Specifies the time interval of each sample (1–255 minutes).

<owner> Specifies the source of the configuration (“auto,” “user”, or “tftp”).

Function

This command displays the last five occurrences of the line statistic. (Note that **dsplnsthathist** the command is the same as **dsplnsthathist**.) The line statistic is selected from the list displayed when this command is first entered. Use the **dsplnstatcnf** to display the statistics enabled on the selected channel. Use **cnflnstats** to enable a statistic.

Figure 1-88 illustrates an example display.

Note You may have to enter owner “auto” in all capital letters.

Statistic Type:

dspphyslnstatcnf (Display Statistics Enabled for a Physical Line)

The **dspphyslnstatcnf** command displays statistics configured as enabled for a selected line on a UXM card.

The **dspphyslnstatcnf** command now lets you configure the additional physical line statistics (which support the ATM Forum compliant IMA protocol). Table 1-58 provides a summary and description of these statistics.

Table 1-58 IMA Physical Line Statistics

Statistics	Statistics
IMA Violations	Near End Rx Unusable Seconds (Rx-UUS-IMA)
Near End Severely Errored Seconds (SES-IMA)	Far End Tx Unusable Seconds (Rx-UUS-IMA-FE)
Far End Severely Errored Seconds (SES-IMA-FE)	Far End Rx Unusable Seconds (Rx-UUS-IMA-FE)
Near End Unavailable Seconds (UAS-IMA)	Near End Tx No. of Failures (Tx-FC)
Far End Unavailable Seconds (UAS-IMA-FE)	Near End Rx No. of Failures (Rx-FC)
Near End Tx Unusable Seconds (Tx-UUS-IMA)	

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfphyslnstats

Syntax

dspphyslnstatcnf <line>

<line> Specifies the line.

Function

This command displays the physical line statistics on a UXM card as enabled by the **cnfphyslnstats** command, by Cisco WAN Manager, or by node features. Figure 1-89 illustrates an example display.

The Owner column identifies who or what set the statistic. If the Owner column shows “Automatic,” the node’s features set the statistic. If the node name appears under Owner, Cisco WAN Manager set the statistic. If the user name appears under Owner, the **cnfchstats** command executed from the command line interface set the statistic.

Last Command: dspphyslnstatcnf 15

Next Command:

dspphyslnstathist (Display Statistics Data for a Physical Line)

The **dspphyslnstathist** command displays a history of statistics configured as enabled for a selected physical line on an active IMA trunk on a UXM card.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

cnfphyslnstats, **dspphyslnstatcnf**

Syntax

dspphyslnstathist <line> <statistic number> <interval> <owner>

- | | |
|--------------------|---|
| <line> | Specifies the circuit line in the format <i>slot.line</i> . If the card set supports only one line, you can enter just the slot number. |
| <statistic number> | Specifies the type of statistic to enable/disable. |
| <interval> | Specifies the time interval of each sample (1–255 minutes). |
| <owner> | Specifies the source of the configuration (“auto,” “user”, or “tftp”). |

Function

This command displays the last five occurrences of the line statistic for a physical line on an active IMA trunk on a UXM card. The line statistic is selected from the list displayed when this command is first entered. Use the **dspphyslnstatcnf** to display the statistics enabled on the selected channel. Use **cnfphyslnstats** to enable a statistic.

Figure 1-90 illustrates an example display.

Note You may have to enter owner “auto” in all capital letters.

This Command: dspphyslnstathist 15

Next Command:

dspportstathist (Display Statistics History for a FR Port)

The **dspportstathist** command displays a history of statistics configured as enabled for a selected Frame Relay port.

Attributes

Jobs: No Log: Yes Lock: Yes Type: IGX

Associated Commands

cnfportstats, **dspportstatcnf**

Syntax

dspportstathist <line> <statistic number> <interval> <owner>

<line> Specifies the circuit line in the format *slot.line*. If the card set supports only one line, you can enter just the slot number.

<statistic number> Specifies the type of statistic to enable/disable.

<interval> Specifies the time interval of each sample (1–255 minutes).

<owner> Specifies the source of the configuration (“auto,” “user”, or “tftp”).

Function

This command displays the data for the last five occurrences of the port statistic. The port statistic is selected from the list displayed when this command is first entered. Use the **dspportstatcnf** to display the statistics enabled on the selected port. Use **cnfportstats** to enable a statistic.

Figure 1-92 illustrates a display for FR port 8.2 DE Frames Dropped (1 second interval) history.

Note You may have to enter owner “auto” or “user” in all capital letters.

Next Command:

dsprevs (Display Revisions)

The **dsprevs** command displays the system software revision running on all nodes in the network.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

runrev, **loadrev**

Syntax

dsprevs

Function

This command displays the configuration and status of the primary and secondary software revisions for all nodes in the network. The primary revision is the software that is running on the node. The secondary revision is the software that is available in memory but not being run. Table 1-59 lists the various status messages. Figure 1-93 illustrates a typical display.

Table 1-59 Status of Node Software Revisions

Status	Description
unavailable	The revision is currently unavailable for the node displayed. The revision has not propagated to the node yet.
available	The node has located the specified revision but has not yet downloaded it.
partial	The revision was only partially downloaded. Indicates the download was temporarily interrupted.
downloading	The revision is in the process of being downloaded. Blocks of data are being transferred.
loaded	The revision has completed downloading but is not ready for running.
upgrading	The controller card is being upgraded by the current revision. This process generally occurs immediately following the download.
upgraded	The upgrade procedure has been completed.
running	The primary revision is currently being used to run the node.

Figure 1-93 dsprevs—Display Revisions

Next Command:

dsprobst (Display Robust Statistics)

The **dsprobst** command displays the statistics associated with the Robust Alarms feature.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

cnfrobparm

Syntax

dsprobst [clear]

[clear] Specifies that the statistics buffers should be cleared after the display.

Function

This command displays the statistics associated with the Robust Alarms messages between the node and Cisco WAN Manager NMS. The optional “clear” argument clears the statistics buffers.

Figure 1-94 illustrates a sample display screen.

Figure 1-94 dsprobst—Display Robust Statistics

dsprst (Display Reroute Statistics)

The **dsprst** command displays the connection rerouting statistics for the network.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

rrtcon, drtop

Syntax

dsprst [s] [clear]

[s]

[clear] Specifies that the reroute statistics buffers should be cleared after the display.

Function

This command displays the statistics related to connection rerouting resulting from failed trunks. These statistics may be useful in determining the performance of the reroute algorithm. Use the “clear” option to clear the counters before accumulating the statistics. Table 1-60 lists reroute statistics.

Table 1-60 Display Reroute Statistics

Statistic	Description
Number of Completed Routes	This is the total number of connections routed since the NPC rebuilt.
Number of Failed Routes	This is the number of attempted reroutes that failed for any reason.
Number of Collisions	During a reroute, the initiating node locks all nodes on the route until rerouting is done. If another node attempts to reroute through a locked node, a collision occurs, so the second node must wait then retry.
Max. # of Consec. Collisions	Is the count of consecutive collisions as defined above.
Max/Avg Secs To Select Route	Time taken within the initiating node to select a new route.
Max/Avg Secs To Perform Route	Time taken to contact and lock the nodes on the new route and perform the rerouting process.
Avg Secs to Route a Conn:	Time to perform a reroute divided by the average number of connections in a bundle.
% of Collisions/Rrt Attempt	Another statistic derived from the number of collisions and the number of reroute attempts.
Max Secs To NOT find Route	Similar to “max secs to select a route” except that the algorithm finished and no route was found.
Number of Routes not found	Number of routes not found in the rerouting process. This parameter updates periodically as a heartbeat to check for activity.

Table 1-60 Display Reroute Statistics (Continued)

Statistic	Description
# of Rrts with rrt req_bit set	Number connections awaiting reroute. If rrt_req bit is set, a reroute was not successful; or trunk deletions or loading additions mean connections must be rerouted. Rerouting clears the rrt_req bit.
Address of Forced Rrt Counts	NPC memory address for database information.
Max routes checked in search	Maximum number of PLNs examined in a search for a new route.
Max good rts checked in search	Maximum number of possible routes found before the search ended. The value should be 1.
# our lns rmvd from under us	Measure the number of changes to topology and loading that occurred while rerouting was in progress.
# lines rmvd out from under us	Same as above.

dspslot (Display Slot)

The **dspslot** command displays system information associated with a specific card in the node.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

none

Syntax

dspslot <slot number>

<slot number> Specifies the shelf slot number.

Function

This command displays system information associated with a specific card in the node. The information can help you debug card failures. When a card failure is reported to the Cisco TAC, the TAC engineer records the parameters for the associated card displayed by using **dspslot**.

The information displayed by the **dspslot** command is unique to the card and is used primarily by the controller card to supervise background system tasks. Figure 1-97 illustrates a typical display—an FRP in this case. Table 1-61 lists the slot parameters you can display on a node.

Use this command to add information on a failed card when you return it. Print the screen or otherwise record the information and return it with the faulty card to Cisco.

Figure 1-97 dspslot—Display Slot Parameters

Table 1-61 Slot Parameters You Can Display on Node

Item	Parameter	Description
1	Logical Card	This number represents the type of card.
2	Verify DB Flag	Verify database flag. Concerned with database and memory.
3	Info Ptr	Information pointer. Concerned with database and memory.
4	Last Event	This is the previous state of the card known to the NPC.
5	Fail Inter	Indicates intermittent card failure.
6	Selftest Fail	Indicates self-test fail condition.
7	Selftest Inter	Indicates intermittent self-test failure.
8	Selftest Timeout	Self-test routine timed out before completion.
9	Con Test Fail	Indicates failure of the test con command.
10	Red LED Flag	Indicates front panel FAIL LED on.
11	Restart Reason	Reason for last card reset.
12	Selftest Results	Results of last self-test for card.
13	Test in Prog	Indicates card test is in progress.
14	Slft Res Abort	Not used.
15	Slft Abort	Not used.
16	Card Stats Up	A "1" indicates statistics are being collected on this card.
17	Sib Pointer	Pointer to database concerning statistics.
18	Summary stats	Pointer to database concerning statistics.
19	Detailed stats	Pointer to database concerning statistics.
20	Bus Mastership	For BCC, this indicates whether this is the slave BCC. For other cards, this is not used.
21	Last Test	Last test performed on card in this slot.

dspslotstathist (Display Statistics History for a BXM Card)

The **dspslotstathist** command displays a history of statistics enabled for a BXM card slot.

Attributes

Jobs: No Log: Yes Lock: Yes Type: BPX

Associated Commands

cnfslotstats, **dspslotstacnf**

Syntax

dspslotstathist <port>

<slot> Specifies the slot.

Function

This command displays the data for the last five occurrences of the slot statistic. The statistic is selected from the list displayed when this command is first entered. Use the **dspslotstacnf** to display the statistics enabled on the selected slot. Use **cnfslotstats** to enable a statistic.

Note You may have to enter owner “auto” or “user” in all capital letters.

dspstatfiles (Display TFTP Statistics File Information)

The **dspstatfiles** command displays TFTP statistics file information for the current node.

Attributes

Privilege: SuperUser Jobs: No Log: No Help: No History: OK Lock: No Hipri: No
Type: BPX and IGX

Associated Commands

dspstatparms, cnfstatparms, cnfnodeparm, dspstatmem

Syntax

dspstatfiles [d]

[d] Optional. Specifies a detailed display for command output.

Function

These files contain statistics for switch objects (such as connections, lines, trunks, ports, and so forth) that are reported to the Cisco WAN Manager (CWM) by means of the Trivial File Transport Protocol (TFTP).

Example

Display TFTP statistics file information for the current node.

dspstatfiles (Display TFTP Statistics File Information)

Default display example:

```
dspstatfiles
sw62          TN      StrataCom      BPX 8620  9.2.36      Jan. 24 2001 01:24 GMT

KEY:A = Active File, S = Switchover occurred, R = Stats Reset, K = Stats Skewed
  E = Stats just enabled, W = Write Failure, M = Made while standby
FILE NAME      FLAGS      FILE NAME      FLAGS
sw62.0124010030 M
sw62.0124010030 M
sw62.0124010045 M

sw62.0000000000 A
```

Last Command:dspstatfiles

Next Command:

```
SW CD          MAJOR ALARM
```

Field definitions for default display:

A = Active File	- The active file.
S = Switchover occurred	- A CC switch over occurred while the file was active.
R = Stats Reset	- While the file was active a user executed the "rststats" command, or a there was a time change large enough to invalidate the current collection.
K = Stats Skewed	- Due to cbus message throttling some statistics polls may have been skipped. The stats were picked up by a later poll, but due to a file rollover the stats were skewed into the new active file.
E = Stats just enabled	- New statistics were enabled while the file was active.
W = Write Failure	- The file could not be written because the file size exceeded the remaining memory allocated for TFTP files. This is an error condition. The software error 2051 is logged to provide information about the error condition.
M = Made while standby	- The stats in the file were collected by the active CC while the current CC was standby.

Display detailed TFTP statistics file information for the current node:

MAJOR ALARM

dspstatmem (Display Statistics Memory Use)

The **dspstatmem** command displays memory usage for statistics collection.

Attributes

Jobs: No Log: Yes Lock: No Node Type: IGX, BPX

Associated Commands

none

Syntax

dspstatmem

Function

This command displays memory usage for statistics collection. It is intended for debugging statistics collection problems, not everyday use. The command shows the amount of controller card memory allocated by the user to statistics display (defaults to 650 Kbytes).

The memory occupied by USER is used for user-enabled statistics. Figure 1-99 illustrates a typical screen. The memory occupied by USER figure is that used by the Cisco WAN Manager user. Memory occupied by AUTO is that used by node features.

Figure 1-99 dspstatmem—Display Statistics Memory Usage

```
sw83                    TN    SuperUser            IGX 8420    9.2            Aug. 1 1998 19:29 PST

User Configured Statistics Memory (In bytes) = 624640

Memory Occupied by USER (In bytes) = 0

Memory Occupied by AUTO (In bytes) = 21584

Last Command: dspstatmem

Next Command:

NWIP Bandwidth Throttle (Kbytes/sec): 32
```

Last Command: dsptcpparm

Next Command:

dsprkcons (Display Trunk Connection Counts)

The **dsprkcons** command displays the number of connections routed over the specified trunk. This command applies to physical and virtual trunks.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

dsprkmcons, **dsplnmcons**

Syntax

dsprkcons <line number>

<line number> Trunk number.

Function

This command displays the total number of connections being carried by the specified trunk. The connections are summed for each terminating node in the network and lists the connection count for the transmit direction (out of the node).

This command is useful in determining the source of dropped packets in cases where the specified trunk is oversubscribed. Use the **dsprks** command to list the trunks that originate at each node. Next, use the **dsprkcons** to determine the number of connections (the more connections per trunk the greater the possibility of over-subscription). Then use the **dsprts** command to identify any through nodes (where the trunk is not terminated). Finally, look at the utilization factor for each of these lines using the **dsputl** and **dsputl** commands. Figure 1-101 illustrates the **dsprkcons** command display.

Figure 1-101 dsprkcons—Display Trunk Connection Counts

```

Last Command: dsprkcons 5.1

Next Command:
```

dsptrkmcons (Display Trunk Connection Counts by Master Node)

The **dsptrkmcons** command displays the number of connections routed over the specified trunk (BNI) by the master node.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

dsptrkcons

Syntax

dsptrkmcons <line number>

<line number> Specified trunk number. Note that in a BPX, the line number must include a port number.

Function

This command displays the total number of connections being carried by the specified trunk. Rather than showing the remote end of the connection, the display lists the connection and the node that owns that connections.

This command is useful in determining the source of dropped packets in cases where the specified trunk is oversubscribed. First, use the **dsptrkmcons** command to list the trunks that originate at each node (the more connections per trunk, the greater the possibility of over-subscription). Next, use the **dsprts** command to identify any through-nodes (on which the trunk is not terminated). Finally, look at the utilization for each of these lines by using the **dsputl** and **dsputl** commands. Figure 1-102 illustrates the **dsptrkmcons** command display.

Figure 1-102 dsptrkmcons—Display Trunk Connection Counts by Master Node

Last Command: dsptrkmcons 6.1

Next Command:

dsprkstatcnf (Display Statistics Enabled for a Trunk)

The **dsprkstatcnf** command displays the enabled statistics a physical or virtual trunk.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnftrkstats

Syntax

dsprkstatcnf <line>

<line> Specifies the trunk: *line* can have the form *slot*, *slot.port* or *slot.port.vtrk*. The format depends on whether the trunk card has one or more physical ports and whether the trunk is a virtual trunk.

Function

This command displays the statistics enabled for a trunk. It is intended for debugging statistics collection problems. It displays the trunk statistics set by the **cnftrkstats** command, by Cisco WAN Manager, or by node features. Figure 1-103 shows example statistics for a T3 ATM trunk. The Owner column shows the source of the specification. If the Owner column shows "AUTO," the node's features determined the statistics. If the Owner column shows the name of the node, Cisco WAN Manager determined the statistics. If the Owner column shows "USER," the **cnftrkstats** command was used to configure the statistics. The display may take up to four screens to display completely depending on statistics displayed.

Next Command:

dsprksthathist (Display Statistics History for a Trunk)

The **dsprksthathist** command displays a history of configured statistics for a physical or virtual trunk.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

cnftrkstats, **dsprksthathist**

Syntax

dsprksthathist <trunk>

<trunk> Specifies the trunk in one of the following formats:
slot for a trunk card with one line
slot.port for a trunk card with more than one line
slot.port.vtrk for a virtual trunk

Function

The **dsprksthathist** command is a statistics debugging command. It displays the data for the last five occurrences of the selected statistic. The available trunk statistics appear on screen upon entry of the **dsprksthathist** command. (The **cnftrkstats** command enables individual statistics. The **dsprksthathist** command displays the enabled statistics for a trunk.) Figure 1-104 displays a statistic history for virtual trunk 1.1.1. The statistic is TX ABR Overflow Dropped Cells. This is statistic number 169. The execution of **dsprksthathist** shows as enabled for this trunk. (If a *disabled* statistic is selected, a message stating this appears above the command line prompt.) The entered bucket interval is 0 minutes, which means that only the preceding 60 seconds worth of gathered data for number 169 appears.

Note Enter the owner in all capital letters. You may have to enter owner "auto" in all capital letters.

dsputil (Display Utilization)

The **dsputil** command displays the utilization factor for all voice connections on a circuit line.

Attributes

Jobs: No Log: No Lock: Yes Node Type: IGX

Associated Commands

dsputil

Syntax

dsputil <bslot> [clear]

<bslot> Specifies the shelf back slot number of the circuit line.

[clear] Directs the controller card to clear the utilization counters after being displayed.

Function

This command displays the actual percentage utilization for all voice connections on a single circuit line specified by the back slot (**bslot**) number. The percentage is calculated by dividing the number of packets transmitted over the total number of packets allocated to the specified channel. Only transmit packet rates are used. If percentage of actual utilization exceeds the configured utilization the channel appears in reverse video.

Figure 1-105 illustrates a typical display. In this example, the connections from 11.1 to 11.11 use VAD and the connections from 11.12 to 11.17 do not. The connections using VAD do not use any network bandwidth (0 utilization) until the connection is used. The other connections utilize the full bandwidth (100% utilization) even though they may be idle.

Use the **dsputil** command to display utilization for data channels.

Figure 1-105 dsputil—Display Voice Channel Utilization

gamma TRM SuperUser Rev: 9.2 Aug. 14 1998 16:36 PDT

Last Command: dsputil 11

Next Command:

getfwrev (Get Firmware Revision)

The **getfwrev** command gets and loads a firmware image from Cisco WAN Manager, Cisco WAN Manager, or a remote node into the specified card on the specified node or on all reachable nodes.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

burnfwrev, dspfwrev, dspdnld

Syntax

getfwrev <card type> <image name> <nodename>

- | | |
|--------------|---|
| <card type> | Specifies the card on which to load the revision. |
| <image name> | Specifies the name assigned to the firmware revision. Image names are generally in all capital letters and are case-sensitive when being entered. |
| <nodename> | Specifies the node on which to load the revision. |

Function

This command gets and loads a firmware revision image into the specified node's NPC memory. This firmware image can then be downloaded to specific interface cards within the node with the **burnfwrev** command. The firmware image must be already loaded into the Cisco WAN Manager or Cisco WAN Manager terminal before using this command.

When the command is first entered, the status is temporarily “Unavailable” while the node attempts to locate the source of the firmware image. Once the download begins, a list of all of the files that make up the image is displayed and as the downloading progresses, the address of the file is updated.

- **getfwrev a.b.cd ***—Loads firmware revision a.b.cd at all reachable nodes
- **getfwrev BNI-E3 a.b.cd nodename**—Loads firmware revision a.b.cd on the BNI-E3 card at one node only (nodename specifies the node).
- **getfwrev 0.0** —Clears a firmware revision image from NPC memory. Should be issued after every firmware download to clear the NPC memory.
- **getfwrev BNI-E3 0.0 nodename**—Clears a firmware revision image from the BNI-E3 card at one node only (nodename specifies the node).

Caution This command is not to be confused with **loadrev**. The **loadrev** command loads system software, not firmware.

killuser (Log Out a User)

The **killuser** command logs out a user.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

none

Syntax

killuser <user number>

<user number> Specifies the number of the user to log out.

Function

This command logs out a user. The **killuser** screen in Figure 1-106 displays a numbered list of users. The number is the argument that **killuser** takes. The display indicates your user number so that you do not log out yourself.

Figure 1-106 killuser—Kill User

This Command: killuser

Please Enter User Number:

loadcnf (Load Configuration)

The **loadcnf** command loads a configuration image from Cisco WAN Manager to a node.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX, IGX/AF

Associated Commands

dspcnf, **runcnf**, **savecnf**

Syntax

loadcnf <backup_id | clear> <node_name> <source_SV_node>

- | | |
|------------------|--|
| <backup_id > | Specifies the name of the backup configuration file to be loaded. Configuration names are case-sensitive. |
| <clear> | Specifies that the control card buffer area used for loading a configuration be cleared. |
| <node name> | Specifies the target node where the backup configuration file is to be loaded. |
| <source_SV_node> | Specifies the node connected to the Cisco WAN Manager where the configuration file <i>backup_id</i> resides. |

Function

This command causes a saved network configuration file to be downloaded from Cisco WAN Manager to one node or all nodes. (See **savecnf**.) The configuration image downloaded is temporarily stored in a buffer area in a node's controller card memory. The process runs in the background and may take several minutes if the configuration file is large. Although loaded, the configuration is not yet restored. The configuration is restored to the controller card's BRAM memory using the **runcnf** command.

After loading and restoring a network configuration, the control card buffer area used for this purpose should be cleared so it is available for other downloading processes, such as that of firmware. To clear the buffer area, execute **loadcnf** with the *clear* parameter specified instead of *backup_id*. Specify the buffer of an individual node with *node_name* or all nodes with *. For the purpose of clearing the buffer area, do not specify the *source_SV_node* parameter.

To execute this command on an IGX/AF interface shelf, telnet to the shelf or use a control terminal attached to the shelf.

loadrev (Load Revision)

The **loadrev** command loads a secondary system software revision image from Cisco WAN Manager into a node.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX, IGX/AF

Associated Commands

runrev, **dsprevs**, **cnfdlparm**, **upggrp**

Syntax

```
loadrev <revision> <node_name | group_name | *>
```

<revision>	Specifies the revision level of the system software file to be loaded.
<node_name>	Specifies the target node where the secondary revision is to be loaded.
<group_name>	Specifies a subset of nodes in the network.
<*>	Specifies all nodes in the network.

Function

This command loads the secondary revision system software for the specified nodes. The secondary revision system software is the code that is loaded onto a controller card but is not being run. Use the **runrev** command (after you have loaded a revision with **loadrev**) to make the secondary revision the primary revision. The primary revision then becomes the secondary.

Examples of this command:

- **loadrev a.b.cd ***—Loads revision a.b.cd at all reachable nodes.
- **loadrev a.b.cd nodename**—Loads revision a.b.cd at nodename only
- **loadrev 0.0**—Clears a software revision image from controller memory. You should issue this command after every software download to clear the controller memory.

After entering the command, the system responds with the following:

```
Enter Rev Number:
```

Use the **dsprevs** command to view the software revisions that are currently loaded in the controller memory. Use the **dsdnld** command to display a running picture of the download procedure status once it has begun. The **runrev** command also displays the lowest revision running in the network.

Caution Do not confuse **loadrev** with **getfwrev**. The **getfwrev** command loads firmware, not system software.

prtcderes (Print Card Errors)

The **prtcderes** command prints out detailed card failure information.

Attributes

Jobs: Yes Log: No Lock: Yes Node Type: IGX, BPX

Associated Commands

clrcderes, **dspcderes**

Syntax

prtcderes [<slot>]

<slot > Specifies the shelf slot where the selected card is installed.

Function

Prints a history of card failures associated with a specified slot on the network printer. If no argument is specified, a summary is printed, indicating the slots that have failures recorded against them. Refer to **dspcderes** command for an example of a typical card error record that might be printed.

rrtcon (Reroute Connection)

The **rrtcon** command is used to manually reroute one or more connections.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

drtop

Syntax

rrtcon <group | channel(s) | *>

<group | channel(s) | *>: Specifies a group, a channel, or a range of channels to be rerouted.
A * specifies all locally owned groups and connections.

Function

This command forces a group, channel or range of channels to be rerouted. If a free-routing connection is rerouted by the system for whatever reason, it will not automatically return to its original route when the trouble clears. This may leave the connection on a path that is not the most direct or cost effective.

You can use **rrtcon** to force a reroute that will likely put the connection back to its original route if that route is available. Over time, many routes may need to be rerouted back to their original paths. In this case, use the "*" parameter with **rrtcon** on the node where you originally executed it to reroute all connections.

To use this command you must first vt to the node that owns the connection (local node). If not at the local node, the system displays "This node is not owner of the connection(s)."

There is no provision for specifying a route. The node determines the connection route according to the same rules that are used when adding a new connection. If no network bandwidth is available for rerouting the connection, the node marks the connection as failed.

Caution Using this command on a connection that is in service should be done with some discretion because the reroute interrupts service for as long as it takes to reroute the connection.

rststats (Reset Statistics Collection Time)

The **rststats** command resets the statistics collection time for the **tststats** command. Executing **rststats** clears all statistics. When you enter it, a prompt warns you that the command clears all statistics and asks if you want to proceed.

Attributes

Jobs: Yes Log: No Lock: Yes Node Type: IGX, BPX

Associated Commands

tststats

Syntax

rststats

Function

This command resets the collection time for the **tststats** command. The **tststats** command displays a test statistics summary. Before there will be any meaningful statistics, the **tstcon** command must be performed on one or more network connections. Refer to the *Cisco WAN Switching Command Reference* for information on the **tstcon** command. Figure 1-107 illustrates the system response.

Figure 1-107 rststats—Reset Statistics Collection Time

```
alpha32            LAN    SuperUser            IGX 8430            9.2            Aug. 30 1998 13:35 PST
```

```
This Command: rststats
```

```
Warning: This command clears all statistics  
Continue?
```

runcnf (Run Configuration)

The **runcnf** command restores a network configuration image at one or all nodes.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX, IGX/AF

Associated Commands

savecnf, **loadcnf**, **clrcnf**

Syntax

```
runcnf <backup_id> <node_name>
```

<backup_id> Specifies the name of the configuration image loaded from Cisco WAN Manager. Configuration names are case-sensitive.

<node_name> Specifies the node name to receive the configuration. An asterisk (*) specifies all nodes.

Function

This command restores the specified configuration to the controller card's BRAM memory and overwrites the current configuration. Once restored, the specified node (or all nodes) rebuilds with the restored configuration image. To execute this command on an IGX/AF interface shelf, telnet to the shelf or use a control terminal attached to the shelf.

This command is usually run after a previous configuration has been lost. If doubts exist about the state of the configuration at other nodes in the network, load the configuration into all nodes by specifying "*" for the node name. The new configuration must have previously been loaded into the controller buffer area with the **loadcnf** command.

Caution All network nodes must be run with the same configuration.

The system may display two warnings in response to the **runcnf** command:

1 When single node specified:

- Warning—node_name not reachable. Continue? Y/N.
- Warning—node_name does not have the specified configuration. Continue? Y/N.

2 When all nodes specified:

- Warning—all nodes not reachable. Continue? Y/N.
- Warning—all nodes do not have the specified configuration. Continue? Y/N.

If a single node is not reachable, responding with a "Y" does not affect the operation of the network. If node(s) do not all have the specified configuration or all are unreachable, it is not recommended that you continue until after the problem is resolved.

runrev (Run Revision)

The **runrev** command runs a specific revision of the system software at a node.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX, BPX

Associated Commands

dsprevs, loadrev, cnfdlparm, upggrp

Syntax

runrev <revision> <node_name | group_name | *>

- | | |
|--------------|--|
| <revision> | Identifies the revision you want to run. |
| <node_name> | Specifies the node name to rebuild with a new configuration. |
| <group_name> | Specifies a subset of nodes in the network. |
| * | Specifies all nodes in the network. |

Function

This command sets the primary revision for the specified nodes. The primary software revision is the one that is actively controlling node operation. You can also load a non-active secondary revision that differs from the primary revision running in the controller. To set the primary software revision, enter:

- **runrev a.b.cd ***—To run revision a.b.cd at all reachable nodes.
or
- **runrev a.b.cd nodename**—To run revision a.b.cd at a single node (nodename) only.

After entering the command, the system responds with “Enter Rev Number.” Use the **dsprevs** command to determine which revision(s)—primary and secondary—are available on the node. The **runrev** command also displays the lowest revision running in the network. The **runrev** command will be ignored if the required revision is not present on the node.

You may need to load the new revision onto the Cisco WAN Manager terminal and then use **loadrev** command to download the new software image into the standby controller before you issue the **runrev** command. If you enter a revision number that does not exist at the node, the system displays the message

“Warning—the node does not have the specified revision. Continue? Y/N”

Caution All network nodes typically should be run with the same software revision to ensure normal network operation.

savecnf (Save Configuration)

The **savecnf** command saves a configuration image on a Cisco WAN Manager workstation disk.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX, BPX, IGX/AF

Associated Commands

loadcnf, **runcnf**, **clrcnf**

Syntax

savecnf <backup_id | clear> <node_name> <dest_SV_node> [<dest_SV_ip>]

<backup_id>	Specifies the name of a configuration to be saved on Cisco WAN Manager. The Backup ID must be 1–8 alphanumeric characters with the first character being alphabetic. Configuration names are case-sensitive.
<clear>	Specifies that the buffer area should be cleared.
<node_name>	Specifies the node name to save configuration on. An * may be specified to indicate all nodes.
<dest_SV_node>	Specifies the node name where Cisco WAN Manager is connected and is to receive the specified backup_id.
<dest_SV_IP>	For IGX/AF interface shelves only, this optional specification is the IP address of the Cisco WAN Manager that is to receive the configuration image.

Function

The **savecnf** command has two possible applications. It saves all the configurations for the nodes in a routing network, or it saves the configuration of one IGX/AF interface shelf to a specific Cisco WAN Manager workstation. Once saved, you can restore the configuration to BRAM by using the **loadcnf** and **runcnf** commands. You should execute **savecnf** in the following situations:

- After making any configuration changes in a network
- Before upgrading to a new system software release

Execution on a Routing Node

In a routing network, **savecnf** saves a configuration image for one node or all routing nodes (*node_name = **) on the Cisco WAN Manager workstation specified by *dest_SV_node*.

Execution on an IGX/AF Interface Shelf

To execute **savecnf** on an IGX/AF, either telnet to the shelf or use a control terminal attached to it: **savecnf** saves a configuration image of only the current shelf. The image is stored on the workstation with the IP address in the parameter *dest_SV_ip*. (In a routing network, *dest_SV_ip* is not necessary.) Note that *node_name* and *dest_SV_node* must *both* be the name of the shelf. The IP address of the destination Cisco WAN Manager workstation uniquely identifies where to store the configuration image.

setfpevt (Set FastPAD Event Reporting)

The **setfpevt** command enables the reporting of FastPAD events.

Attributes

Jobs: No Log: Yes Lock: Yes Node Type: IGX

Associated Commands

clrfpevt, **dsplog**

Syntax

```
setfpevt <slot.port>
```

<slot.port> Specifies the slot and port of the FastPAD.

Function

Executing **setfpevt** restarts FastPAD event logging after you have stopped logging by using **clrfpevt**.

The reason for executing **clrfpevt** is to prevent the large number of logged events that accumulate when certain user-controlled disruptions occur. Without suspension of event-logging, the number of events caused by the disruption can cause the FastPAD to become unreachable. Examples of these events are

- FTM Y-cable switchover
- NPM/NPC switchovers
- Adding a connection by using the **addrcons** command
- Resetting the FastPAD (power cycling or by the **resetfp** command)

Example

```
setfpevt 9.3
```

Description

The example command resumes event logging for the FastPAD connected to port 9.3.

Note No screen appears when **setfpevt** executes. The example shows the **dsplog** output after a sequence of **clrfpevt** then **setfpevt**. Earlier FastPAD events appear near the bottom of the screen.

Figure 1-108 illustrates a typical report of FastPAD events.

tststats (Test Statistics)

The **tststats** command displays a summary of the test statistics that result from performing a **tstcon** command on various network connections.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

tstcon

Syntax

tststats [clear]

[clear] Specifies that the test statistics buffers be cleared.

Function

Before **tststats** displays any meaningful statistics, the **tstcon** command must run on one or more network connections. Refer to the *Cisco WAN Switching Command Reference* for information on the **tstcon** command. The following are displayed for voice, data, and Frame Relay connections.

- Tests Completed, Passed, Failed, and Aborted.
- Failure data per failed connection (applies only to voice connections).
- Slot.channel—Indicates which connection has failed.
- Good reads—Indicates number of good reads on the test failure.
- Bad reads—Indicates number of bad reads on the test failure.

Figure 1-109 illustrates a typical test statistics display.

Note The **tstcon** command should have run before you enter **tststats**.

tstbadubus

You can use the **tstbadubus** command to test an NTM corruption problem. It can be used any time you encounter a possible cell drop problem. Issue the **tstbadubus** command to make sure the problem is not caused by the UBU allocation.

Attributes

Jobs: Yes Log: Yes Lock: Yes Node Type: IGX

Associated Commands

dspbusbw, **cnfbusbw**

Syntax

tstbadubus

Function

The **tstbadubus** command checks every allocated UBU to see if the above problem exists. If an allocation problem is detected, the falsely allocated UBUs will be displayed.

Tests the NTM-UXM/NPM UBU corruption problem.

The NTM card has been known to corrupt Lane 1 of its previous UBU. But it only affects the cells, not FastPackets. Thus it may corrupt data for the UXM card (cells) and NPM (AAL5 cells) if their UBUs are located in front of the one for the NTM card.

For example, if UBU 2 is used by the NTM, the cells (not FastPackets) in Lane 1 of UBU 1 will be corrupted. Because the UXM and NPM are the only cards using the cells in the bus, the UBU immediately before the one used by NTM cannot be allocated to the UXM or NPM.

The UBU allocation software will not assign UBUs for a UXM and an NPM card, if it is next to the one for NTM (to avoid the problem mentioned above).

The **tstbadubus** command checks every allocated UBU to see if the above problem exists. If an allocation problem is detected, the falsely allocated UBUs will be displayed.

Workaround

If the **tstbadubus** screen shows something similar to the screen in Example 1, then reallocating the UBU to slot 8 may cure the problem.

Issue the **dspbusbw <8>** command to see how many UBUs are currently allocated to slot 8. If the allocated UBU is 10, then always add one more UBU to the card. Use **cnfbusbw <8> <11>** to allocate 11 UBUs to slot 8. Most of the time, this change can remove the corruption condition.

If the problem persists, then add two more UBUs to the card. The idea is that by adding one or two more UBUs to the card, the UBU locations to be allocated change, which may cure the problem. Reallocating one or two fewer UBUs may also work.

Full Name

Test NTM corruption problem

Syntax
tstbadubus

Related Commands
dspbusbw, cnfbusbw

Example 1
tstbadubus

Description
The 24th UBU in page 3 was “badly” allocated (causing corruption). It is allocated to the NTM located at slot 4. This UBU corrupts the UBU allocated to the UXM located at slot 8. A cell drop will be expected for slot 8 due to the corruption.

Figure 1-110 shows the system response to the **tstbadubus** command.

upggrp (Upgrade Groups)

The **loadrev** and **runrev** commands take “upgrade group” names as arguments, allowing you to upgrade any subset of nodes at the same time.

Previous to Release 9.1, you could specify either a single node name, or an ‘*’ (asterisk) to specify all nodes in the network, as an argument to **runrev** or **loadrev**. An “upgrade group” is a list of nodes, which could be all nodes in the network. Instead of running **runrev** for each node to be upgraded, upgrading an entire group of nodes at one time leads to a synchronized upgrade process (which the “staggered update mechanism” relies on). The staggered mechanism prevents a situation where many nodes send messages to a single node at the same time.

After an upgrade, each node requests information from every node about its topology and connection database to compensate for any errors or race conditions that may occur during the upgrade. Every node sends its messages to only one node during a given interval. If all nodes start sending these updates at the same time (and the interval is configured the same on all nodes), then all nodes will send messages to different nodes as everyone has a different node number. Whenever the interval ends, they start sending to a node with the next node number. If they would not start at the same time, there would be overlaps as one node could be in its first interval, whereas others are already in the second or third interval.

If all nodes start at the same time, it is guaranteed that one node will exchange updates with only one other node during a given interval, reducing the amount of stress that would occur when multiple nodes send updates to one node at the same time.

Attributes

Jobs: No Log: No Lock: No Node Type: IGX, BPX

Associated Commands

dsprevs, **cnfdlparm**, **loadrev**, **runrev**

Syntax

upggrp [-c[reate] | -d[ele]te] | -s[how]] <group_name>

upggrp [-a[dd] -r[emove]] <group_name> <node_list>

Function

This command creates a group of nodes to be upgraded by the **loadrev** and **runrev** commands. To create an upgrade group type

upggrp -c <group name>

You can create up to 20 upgrade groups. Naming the upgrade groups follows the same convention as for node names; that is, choose group names that are different from the node names in the network. If **loadrev** or **runrev** encounter a name conflict, the commands chose the node name interpretation.

Note Upgrade groups are only known on the node where they are created. They are neither sent to the Standby, nor saved in BRAM. It is assumed they are needed for a short time only. Once the upgrade is done, you can delete the groups.

To delete an upgrade group that is no longer needed, enter:

```
upggrp -d <group name>
```

This frees up the resources used by that group.

To show (list) the currently defined upgrade groups, enter:

```
upggrp -s
```

To list all the member nodes of a group, enter:

```
upggrp -s <group name>
```

To add several nodes to an upgrade group, enter:

```
upggrp -a <group name> <node 1> <node 2> ...
```

The length of the node list can be as long as the command line allows. If an entry is invalid, that is, it is not a valid node name or not a name of a node in the network, an error message prints, and the remainder of the node list is not processed. The nodes before the invalid node are added to the group.

After the command is executed, the members of the group are listed. You can add nodes to an upgrade group in multiple iterations.

To remove a node or several nodes from an upgrade group, enter:

```
upggrp -r <group name> <node 1> <node 2> ...
```

The length of the node list can be as long as the command line allows. If an entry is invalid, that is, it is not a valid node name or not the name of a node in the net, an error message is printed, and the remainder of the node list is not processed. The nodes before the invalid node name are removed from the group. After the command is executed, the members of the group are listed.

Table 1-62 describes the parameters of the **upggrp** command.

Table 1-62 upggrp Command Parameters

Parameters	Description
<code>upggrp -d[delete] <group name></code>	delete a user group
<code>upggrp -s[how] [<group name>]</code>	show the defined upgrades group(s)
<code>upggrp -a[ddnode] <group name> <list of node names></code>	add nodes to the group
<code>upggrp -r[emovencode] <group name> <list of node names></code>	remove list of nodes from group
